There is a wealth of evidence ⓐ<u>that</u> when parents, teachers, supervisors, and coaches are perceived as involved and caring, people feel happier and more motivated. And it is not just those people with power — we need to feel valued and respected by peers and coworkers. Thus, when the need for relatedness is met, motivation and internalization are fueled, ⓑ<u>provided</u> that support for autonomy and competence are also there. If we are trying to motivate others, a caring relationship is a crucial basis ⓒ<u>which</u> to begin. And when we are trying to motivate ⓓ<u>ourselves</u>, doing things to enhance a sense of connectedness to others can be crucial to long-term persistence. So exercise with a friend, call someone when you have a difficult decision to make, and ⓔ<u>be there</u> as a support for others as they take on challenges.

Chess masters shown a chess board in the middle of a game for 5 seconds with 20 to 30 pieces still in play can immediately reproduce the position of the pieces from memory. Beginners, of course, are able to place only a few. Now take the same pieces and place them on the board randomly and the difference is much reduced. The expert's advantage is only for familiar patterns — those previously stored in memory. Faced with unfamiliar patterns, even when it involves the same familiar domain, the expert's advantage disappears.

The beneficial effects of familiar structure on memory have been observed for many types of expertise, including music. People with musical training can reproduce short sequences of musical notation more accurately than those with no musical training when notes follow conventional sequences, but the advantage is much reduced when the notes are ordered randomly. Expertise also improves memory for sequences of movements. Experienced ballet dancers are able to repeat longer sequences of steps than less experienced dancers, and they can repeat a sequence of steps making up a routine better than steps ordered randomly. In each case, memory range is increased by the ability to recognize familiar sequences and patterns.

According to educational psychologist Susan Engel, curiosity begins to decrease as young as four years old.

(A) By the time we are adults, we have fewer questions and more default settings. As Henry James put it, "Disinterested curiosity is past, the mental grooves and channels set." The decline in curiosity can be traced in the development of the brain through childhood. Though smaller than the adult brain, the infant brain contains millions more neural connections.

(B) As children absorb more evidence from the world around them, certain possibilities become much more likely and more useful and harden into knowledge or beliefs. The neural pathways that enable those beliefs become faster and more automatic, while the ones that the child doesn't use regularly are pruned away.

(C) However, the wiring is a mess; the lines of communication between infant neurons are far less efficient than between those in the adult brain. The baby's perception of the world is consequently both intensely rich and wildly disordered.

Improving your gestural communication involves more than just knowing when to nod or shake hands. It's about using gestures to complement your spoken messages, adding layers of meaning to your words. Open-handed gestures, for example, can indicate honesty, creating an atmosphere of trust. You invite openness and collaboration when you speak with your palms facing up. This simple yet powerful gesture can make others feel more comfortable and willing to engage in conversation. But be careful of the trap of overgesturing. Too many hand movements can distract from your message, drawing attention away from your words. Imagine a speaker whose hands move quickly like birds, their message lost in the chaos of their gestures. Balance is key. Your gestures should highlight your words, not overshadow them.

> Yet once it becomes possible to transform an embryo's mutated genes into "normal" ones, there will certainly be temptations to upgrade normal genes to superior versions.

(A) Assuming gene editing in humans proves to be safe and effective, it might seem logical, even preferable, to correct disease-causing mutations at the earliest possible stage of life, before harmful genes begin causing serious problems. (B) Should we begin editing genes in unborn children to lower their lifetime risk of heart disease or cancer? (C) What about giving unborn children beneficial features, like greater strength and increased mental abilities, or changing physical characteristics, like eye and hair color? If we adopt technology, we need to pay its costs. Thousands of traditional livelihoods have been pushed aside by progress, and the lifestyles around those jobs removed. Hundreds of millions of humans today work at jobs they hate, producing things they have no love for. Sometimes these jobs cause physical pain, disability, or chronic disease. Technology creates many new jobs that are certainly dangerous. At the same time, mass education and media train humans to avoid low-tech physical work, to seek jobs working in the digital world. The divorce of the hands from the head puts a stress on the human mind. Indeed, the sedentary nature of the best-paying jobs is a health risk - for body and mind.

*chronic: 만성의 **sedentary: 주로 앉아서 하는

① The costs of adopting new technology have made people give up using it.
② Thanks to the development of technology, people can avoid various diseases.
③ Mass education and media play a role in leading people to occupations related to digital technology.
④ Technology has produced a number of dangerous jobs that need low-tech physical work.
⑤ A job requiring high technology is ideal for human health.

AI image generators create images based on our text requests. They do this by ⓐcopying other images that were created by humans. The generators have the ability to analyze millions of images and their corresponding descriptions. This allows them ⓑcreated works of art in a short time based on the provided instructions. Moreover, AI programs can mix the styles of existing images upon request. For example, you can blend a photograph of a cat ⓒwith Johannes Vermeer's Girl with a Pearl Earring. These two images have ⓓa few differences. However, the overall design, the eyes, and the scarf around the head are clearly based on Vermeer's painting. The major philosophical shift in the idea of selling came when industrial societies became more affluent, more competitive, and more ⓐgeographically spread out during the 1940s and 1950s. This forced business to develop closer relations with buyers and clients, which in turn made business ⓑrealize that it was not enough to produce a quality product at a reasonable price. In fact, ⓒit was equally essential to deliver products that customers actually wanted. Henry Ford produced his best-selling T-model Ford in one color only (black) in 1908, but in modern societies this was no longer possible. The modernization of society led to a marketing revolution that destroyed the view ⓓwhich production would create its own demand. Modern brainscanning techniques such as fMRI (functional Magnetic Resonance Imaging) have revealed that reading aloud lights up many areas of the brain. ⓐThere is intense activity in areas associated with pronunciation and hearing the sound of the spoken response, which strengthens the connective structures of your brain cells for more brainpower. ⓑThis leads to an overall improvement in concentration. ⓒLack of sleep and not having breakfast often can impair our concentration on daily life. ⓓReading aloud is also a good way to develop your public speaking skills because it forces you to read each and every word — something people don't often do when reading quickly, or reading in silence. ⓔChildren, in particular, should be encouraged to read aloud because the brain is wired for learning through connections that are created by positive stimulation, such as singing, touching, and reading aloud.

Promotion deals with consumer psychology. We can't force people to think one way or another, and the clever marketer knows that promotion is used to provide information in the most clear, honest, and simple fashion possible. By doing so, the possibility of increasing sales goes up. Gone are the days when promotions were done in order to fool the consumer into purchasing something. The long-term effect of getting a consumer to buy something they did not really want or need wasn't good. In fact, consumers fooled once can do damage to sales as they relate their experience to others. Therefore, marketers now should identify where the potential consumers are, and then promote certain goods or services in a way that makes the value clear to the consumer.

The science we learn in grade school is a collection of certainties about the natural world — the earth goes around the sun, DNA carries the information of an organism, and so on. Only when you start to learn the practice of science do you realize that each of these "facts" was hard won through a succession of logical inferences based upon many observations or experiments. The process of science is less about collecting pieces of knowledge than it is about reducing the uncertainties in what we know. Our uncertainties can be greater or lesser for any given piece of knowledge depending upon where we are in that process — today we are quite certain of how an apple will fall from a tree, but our understanding of the turbulent fluid flow remains a work in progress after more than a century of effort.

② roles of advanced technology in validating scientific proofs
③ progressive reduction of uncertainties in scientific inquiry
④ importance of memorizing basic facts in science education
⑤ values of scientific journals in spreading innovative consequences of experiments

Our skin conducts electricity more or less efficiently, depending on our emotions. We know that when we're emotionally (A)[stimulated / stimulating] – stressed, sad, any intense emotion, really – our bodies sweat a tiny bit, so little we might not even notice. And when those tiny drops of sweat appear, our skin gets more electrically conductive. This (B)[change / changes] in sweat gland activity happens completely without your conscious mind having much say in the matter. If you feel emotionally intense, you're going to notice an increase in sweat gland activity. This is particularly (C)[usefully / useful] from a scientific viewpoint, because it allows us to put an objective value on a subjective state of mind. We can actually measure your emotional state by tracking how your body subconsciously sweats, by running a bit of electricity through your skin. We can then turn the subjective, subconscious experience of emotional intensity into an objective number by figuring out how good your skin gets at transferring an electrical current.

Natural processes form minerals in many ways. For example, hot melted rock material, called magma, cools when it reaches the Earth's surface, or even if it's trapped below the surface. ⓐAs magma cools, its atoms lose heat energy, move closer together, and begin to combine into compounds. ⓑA steam magmatic eruption is an eruption activity caused by the physical interaction of magma. During this process, atoms of the different compounds arrange themselves into orderly, repeating patterns. ⓒThe type and amount of elements present in a magma partly determine (A)which minerals will form. Also, the size of the crystals that form depends partly on how rapidly the magma cools. ⓓWhen magma cools slowly, the crystals that form are generally large enough to see with the unaided eye. ⓔThis is because the atoms have enough time to move together and form into larger crystals. When magma cools rapidly, the crystals that form will be small. In such cases, you can't easily see individual mineral crystals.

Plato argued that when you see something beautiful that ⓐattracts you, you are really just seeing a partial reflection of true beauty, just as a painting or even a photograph only captures part of the real thing. True beauty, or what Plato calls the Form of Beauty, is not ⓑabstract in terms of color, shape, or size. Rather, it is a ⓒconceptual idea, like the number five. You can make drawings of the number five in blue or red ink, big or small, but the number five itself is none of those things. It has no ⓓmaterial form. Think of the idea of a triangle, for example. As you listen to your child in an emotional moment, be aware that sharing simple observations usually works better than asking questions to get a conversation rolling. You may ask your child "Why do you feel sad?" and she may not have a clue. As a child, she may not have an answer on the tip of her tongue. Maybe she's feeling sad about her parents' arguments, or because she feels overtired, or she's worried about a piano recital. But she may or may not be able to explain any of this. And even when she does come up with an answer, she might be worried that the answer is not good enough to justify the feeling. Under these circumstances, a series of questions can just make a child silent. It's better to simply reflect what you notice. You can say, "You seem a little tired today," or, "I noticed that you frowned when I mentioned the recital," and wait for her response.

① Share your own life stories before correcting children's emotional problems.
② Teach children in an emotional moment how to explain their feeling exactly.
③ Don't rush to help children out. Leave them alone to figure things out for themselves.
④ Don't press on a child in a negative emotion. Be better say what you saw and then wait.
⑤ Let children know what their strengths are for themselves after sharing simple observation.

People sometimes mistakenly assume that because a person has one type of characteristic, then they automatically have other characteristics which go with it. In one study, university students were given descriptions of a guest lecturer before he spoke to the group. Half the students received a description containing the word 'warm', the other half were told the speaker was 'cold'. The guest lecturer then led a discussion, after which the students were asked to give their impressions of him. It is no surprise that there were large differences between the impressions formed by the students, depending upon their original information of the lecturer. It was also found that those students who perceived the lecturer as warm tended to interact with him more. This shows that different _____ not only affect the impressions we form but also our behaviour and the relationship which is formed.

Managers are always looking for ways to increase productivity, which is the ratio of costs to output in production. Adam Smith, writing when the manufacturing industry was new, described a way that production could be made more efficient, known as the "division of labor." Making most manufactured goods involves several different processes using different skills. Smith's example was the manufacture of pins: the wire is straightened, sharpened, a head is put on, and then it is polished.

One worker could do all these tasks, and make 20 pins in a day. But this work can be divided into its separate processes, with a number of workers each performing one task. Because each worker specializes in one job, he or she can work much faster without changing from one task to another. Now 10 workers can produce thousands of pins in a day — a huge increase in productivity from the 200 they would have produced before.

[B]

Small Steps, Huge Gains: The Power of Division

Can one person truly do it all? Adam Smith argued that the "division of labor" is the secret to industrial (A)_____. This essay will explain how breaking down complex processes into distinct tasks exponentially boosts productivity.

First, dividing labor allows workers to master a single, (B)_____ process. In pin manufacturing, instead of one person performing every step, individuals focus only on one action, such as straightening and (C)_____ the wire. This concentration eliminates the time wasted when switching between tasks, making the workflow much faster and more precise.

Consequently, this focused teamwork leads to a staggering growth in results, (D)_____ the total output to thousands of units. While ten workers might produce only 200 pins individually, they can achieve much more when their efforts are synchronized. This massive leap proves that the sum of parts is far greater than any individual effort.

In conclusion, the division of tasks is the essential engine of progress. As we enter the digital age, we must ask: can this same logic solve our modern, complex challenges? We should embrace these roles to turn simple labor into a collective masterpiece.
