교과서3과 본문1

(A) As a result, the digestion process is paused until the blood returns. So, whether you're lifting weights or going for a jog, you shouldn't do it with a stomach full of food.

(B) But when you start to exercise, blood moves from the digestive system to your muscles. This happens in order to supply your muscles with the oxygen and nutrients they require.

(C) 《Timing is Everything》

(D) Today we're going to be talking about exercise.

(E) Why did that happen? Dr. Hill: Well, the problem is that you exercised too soon after eating.

(F) I worked out right after dinner and got a stomachache.

(G) This can cause various stomach issues. When you eat, blood rushes to the digestive system to help break down the food and absorb its nutrients.

(H) Dr. Victoria Hill is here, and she is going to share some useful tips.

(I) Host: Welcome back to Today's Health.

(J) So, Dr. Hill, let's start with a question about my experience last month.

_____

교과서3과 본문2

(A) Dr. Hill: No, it doesn't. That can also be harmful and unpleasant.

(B) When this glucose is stored in parts of the body, such as the muscles and the liver, it is called glycogen.

(C) Host: I see. That makes sense.

(D) So, does that mean I should exercise on an empty stomach?

(E) Some people end up suffering from nausea and headaches, and others even faint. This is because intense exercise uses up all the glycogen in your muscles.

(F) If you exercise on an empty stomach, you will most likely lack energy and feel unusually tired. There can also be more serious outcomes.

(G) This is why exercising on a completely empty stomach — such as when you first wake up in the morning — can be such a challenge. Your blood sugar levels are low, and you don't have enough glycogen stored in your body.

(H) Carbohydrates in the food we eat are broken down into a kind of sugar called glucose.

(I) This is because the body needs energy to exercise.

(J) The fuel that provides this energy is glycogen.

_____

교과서3과 본문3

(A) Dr. Hill: That's correct. For this reason, doctors recommend that people eat food containing carbohydrates within thirty minutes after working out.

(B) Host: So, is it the loss of glycogen that causes us to have low levels of energy?

(C) Let's do the math.

(D) This replaces the muscle glycogen you have lost.

(E) If you weigh 60 kilograms, you should try to consume between 60 and 90 grams of carbohydrates after you exercise.

(F) This is equal to about one bowl of white rice or three bananas.

(G) Basically, you need between one and one and a half grams of carbohydrates for every kilogram you weigh.

_____

교과서3과 본문4

(A) But, if you wait too long to exercise after eating, you'll suffer from a lack of energy.

(B) Dr. Hill: Well, as I said before, exercising right after you eat will cause feelings of discomfort.

(C) The best time to eat before you exercise varies from one to three hours.

(D) The type of exercise also matters.

(E) For extremely active exercise like cycling, I suggest that you wait between one and a half and three hours after eating a moderate-sized meal.

(F) Basically, it depends on several factors such as the type and amount of food as well as body size, age, and gender.

(G) Can you explain how long we should wait after eating?

(H) But for something more casual, such as golfing, waiting for one hour after a meal should be enough. Clearly, you can wait less after eating a snack.

(I) Host: Thank you very much for this fascinating information, Dr. Hill. I'm sure it will be very helpful for all of our viewers.

(J) Host: That's very interesting. But what about eating before we exercise?

_____

교과서4과 본문1

(A) One evening, she discovered that a homeless man was lying on the street without moving.

(B) Klara closely observed what she saw, hoping to learn everything necessary to be a caring and helpful AF.

(C) At the robot store, she enjoyed taking in the outside world from the windows.

(D) Klara believed the Sun had saved him and came to have strong faith in the Sun's power to restore everything.

(E) Klara is an AF (Artificial Friend), a companion robot for children.

(F) She stays healthy when she gets the Sun's nourishment but feels weak and lifeless without sunlight.

(G) Klara was sad as she believed he had died.

(H) She is solar-powered.

(I) But the next morning when the Sun was shining, she was surprised to see that the homeless man was sitting up and stroking his dog.

(J) <Klara and the Sun by Kazuo Ishiguro>

교과서4과 본문2

(A) I know how bad you'll feel after people promise you perfect things and they turn out not to be so.

(B) Josie chatted with Klara joyfully.

(C) Josie: I really want you to come to my home. I think you'll like my room, and we'll see the beautiful sunset from the windows there.

(D) Klara: (nodding hopefully)

(E) One day, a fourteen-year-old girl named Josie visited the shop with her mother, Chrissie.

(F) Klara: If there's anything difficult or scary, we will face it together.

(G) Some days I'm not so healthy or happy. I do not know why. Do you still want to come, Klara?

(H) We can do all the great things together all the time while I'm growing up. You want to come, right?

(I) Josie immediately took a liking to Klara and asked whether Klara wanted to be her friend.

(J) Josie: That's so good, but I want to be honest with you.

교과서4과 본문3

(A) Pleased by Klara's gesture of friendship, Josie asked Chrissie for her permission to buy the AF.

(B) Chrissie asked Klara what she had observed about Josie, and found Klara to be highly observant.

(C) In Josie's country home, Klara found out that Josie had gone through a procedure known as "lifting."

(D) To show that she would do her best to be Josie's friend, Klara held her hands together and shook them slightly.

(E) By being lifted, Josie's cognitive abilities had been genetically enhanced so that she had a better chance of getting into prestigious universities.

(F) After requesting that Klara continue to care about Josie, Chrissie agreed to buy Klara and took her home.

(G) However, Josie was suffering from serious side effects similar to those that had claimed the life of her sister, Sal.

(H) A mysterious chronic illness often caused her to stay in bed for days on end.

(I) Because of this, Josie spent most of her time at home and was being educated there.

교과서4과 본문4

(A) One day when Josie felt better, her mother took her and Klara to the city so that Josie could have her portrait done by Mr. Capaldi.

(B) Looking around the studio after completing the questionnaire, Klara entered Capaldi's office.

(C) I now understand why Chrissie asked me, at every step, to observe and learn Josie.

(D) Capaldi: Klara, tell me what you think about the replica.

(E) In Capaldi's studio, Klara was asked to answer a questionnaire about Josie.

(F) Klara: It resembles Josie quite accurately. Mr. Capaldi, you have done a good job of capturing Josie's appearance.

(G) To her surprise, she saw something that looked like Josie suspended in the air — it was an AF replica of Josie's body!

(H) As it turned out, Mr. Capaldi was not a painter but a scientist, who planned with Chrissie to transfer Klara's consciousness to the replica and make a new Josie if the real Josie were to die.

(I) The survey seems to test how well I have come to know Josie and how well I understand her decisions and feelings.

교과서4과 본문5

(A) Learn Josie, not just superficially, but deeply, entirely.

(B) You have to continue her for Chrissie and for everyone else who loves Josie.

(C) If the day comes when you do need the new Josie, I will do my best to become as close to her as possible. However, it is wrong to give up hope already.

(D) But there is nothing like that. The new Josie won't be an imitation. She will be the exact same person and you will have every right to love her just as you love Josie now.

(E) That is why I agreed with you on this replica, but however well you make it, I don't think I will be able to accept this AF as my Josie. Capaldi: You must not lose faith, Chrissie.

(F) The survey Klara has successfully completed is clear evidence that she is already well on her way to understanding all of Josie's drives and desires. You believe that there is something unreachable inside each of us, something that is unique and won't transfer.

(G) Chrissie: But will I believe in it? When the day comes, will I really? Klara: Excuse me, but I would like to say there is a chance you will never need the new Josie. She may overcome her illness.

(H) I'm still not sure if this whole plan is the best thing we can do. I have been afraid of losing Josie ever since I lost Sal.

(I) Chrissie: I have doubts.

(J) Capaldi: We will ask you to become her and to live in that replica of Josie with everything you have learned.

교과서4과 본문6

(A) Believing it to be the Sun's resting place, Klara visited there to pray to the Sun for Josie's recovery.

(B) I have never forgotten how strong your power to restore everything is.

(C) This made Klara determined to do everything she could for Josie.

(D) Klara: You must be so tired, and I'm very sorry to disturb you, but I have come here this evening to ask a special favor.

(E) Josie is becoming weaker and weaker each day.

(F) Out of gratitude and respect, Klara continued to look at the Sun until his last light vanished into the ground.

(G) The Sun was then sinking into the ground, but Klara could tell he was smiling at her as he went down for his nightly rest.

(H) Josie's health took a turn for the worse after she returned from the city.

(I) Please send Josie the special nourishment she so desperately requires as you did that day to the homeless man.

(J) Klara remembered the barn into which the Sun had disappeared when she and Josie had been watching the sunset in Josie's room.

교과서4과 본문7

(A) But I don't think it would have worked out so well. Not because I wouldn't have achieved accuracy, but however hard I tried, I believe now there would have remained something beyond my reach.

(B) Klara: Josie was the best teenager for me.

(C) After several rainy days, the Sun came out to shine light on Josie and her whole bed.

(D) When Josie left for college, Klara was sent to the Yard, a place where old AFs spend their remaining days at the end of their lives.

(E) If it had become necessary, I could have continued Josie.

(F) I did all I could to learn Josie and to do what was best for her.

(G) I would have never reached what they felt for Josie in their hearts. I am sure of this now.

(H) Josie woke up and made a miraculous recovery. Seasons and years went by, and she grew into a healthy adult.

(I) Mr. Capaldi believed there was nothing special inside Josie, but I believe now that there was something very special. But it wasn't inside Josie. It was inside those who loved her.

(J) In the Yard, she remembered her days with Josie.

230932

(A) This and so many more tricks of language are what de Waal has termed "linguistic castration."

(B) If an animal can beat us at a cognitive task — like how certain bird species can remember the precise locations of thousands of seeds — they write it off as instinct, not intelligence.

(C) The famous primatologist Frans de Waal, of Emory University, says humans downplay similarities between us and other animals as a way of maintaining our spot at the top of our imaginary ladder.

(D) The way we use our tongues to disempower animals, the way we invent words to maintain our spot at the top.

(E) Scientists, de Waal points out, can be some of the worst offenders — employing technical language to distance the other animals from us.

(F) They call "kissing" in chimps "mouth-to-mouth contact"; they call "friends" between primates "favorite affiliation partners"; they interpret evidence showing that crows and chimps can make tools as being somehow qualitatively different from the kind of toolmaking said to define humanity.

230934

(A) For many people, ability refers to intellectual competence, so they want everything they do to reflect how smart they are — writing a brilliant legal brief, getting the highest grade on a test, writing elegant computer code, saying something exceptionally wise or witty in a conversation.

(B) An outstanding performance means an outstanding person; an average performance means an average person. Period.

(C) However ability may be defined, a problem occurs when it is the sole determinant of one's self-worth.

(D) The performance becomes the only measure of the person; nothing else is taken into account.

(E) You could also define ability in terms of a particular skill or talent, such as how well one plays the piano, learns a language, or serves a tennis ball.

(F) Some people focus on their ability to be attractive, entertaining, up on the latest trends, or to have the newest gadgets.

230935

(A) They will also connect to motor nerves that travel back down the spinal cord, and to the muscles in your leg that now contract quickly to lift your foot away from the painful object.

(B) While the pain itself is unpleasant, it is in fact acting as a protective mechanism for the foot.

(C) Sensory nerves have specialized endings in the tissues that pick up a particular sensation.

(D) Sensory and motor nerves control almost all functions in the body — from the beating of the heart to the movement of the gut, sweating and just about everything else.

(E) If, for example, you step on a sharp object such as a pin, nerve endings in the skin will transmit the pain sensation up your leg, up and along the spinal cord to the brain.

(F) Within the brain, nerves will connect to the area that controls speech, so that you may well shout 'ouch' or something rather less polite.

230941~42

(A) Claims that local food production cut greenhouse gas emissions by reducing the burning of transportation fuel are usually not well founded.

(B) For example, field-grown tomatoes shipped from Mexico in the winter months will have a smaller carbon footprint than local winter tomatoes grown in a greenhouse.

(C) In the United Kingdom, lamb meat that travels 11,000 miles from New Zealand generates only one-quarter the carbon emissions per pound compared to British lamb because farmers in the United Kingdom raise their animals on feed (which must be produced using fossil fuels) rather than on clover pastureland.

(D) Food coming from a distance can actually be better for the climate, depending on how it was grown.

(E) Bulk loads of food can travel halfway around the world by ocean freight with a smaller carbon footprint, per pound delivered, than foods traveling just a short distance but in much smaller loads.

(F) When food does travel, what matters most is not the distance traveled but the travel mode (surface versus air), and most of all the load size.

(G) For example, 18-wheelers carry much larger loads than pickup trucks so they can move food 100 times as far while burning only one-third as much gas per pound of food delivered.

(H) Transport is the source of only 11 percent of greenhouse gas emissions within the food sector, so reducing the distance that food travels after it leaves the farm is far less important than reducing wasteful energy use on the farm.

231133

(A) We might take the platypus as an individual, or we might treat it as part of a larger unit such as a species or an ecosystem.

(B) It's possible to move between many of these perspectives, although we may need some additional tools and skills to zoom in on individual pieces of hair or zoom out to entire ecosystems.

(C) Every possible perspective involves emphasizing certain aspects and ignoring others.

(D) Crucially, however, we can only take up one perspective at a time.

(E) Take platypuses. We might zoom in so closely to their fur that each hair appears different.

(F) Anthropologist Gregory Bateson suggests that we tend to understand the world by focusing in on particular features within it.

(G) We might also zoom out to the extent where it appears as a single, uniform object.

(H) We can pay attention to the varied behavior of individual animals, look at what unites them into a single species, or look at them as part of bigger ecological patterns.

250334

(A) It's more likely that these reactions are kneejerk survival actions. Plants are living organisms, and their main objective is to survive. Scents and sounds are their tools for defending against things that might harm them.

(B) Researchers experimented with plants and microphones to see if they could record any trouble calls. They found that plants produce a high-frequency clicking noise when stressed and can make different sounds for different stressors.

(C) Plants can communicate, although not in the same way we do. Some express their discontent through scents.

(D) You know that smell that hangs in the air after you've mowed the lawn? Yeah, that's actually an SOS. Some plants use sound. Yes, sound, though at a frequency that we can't hear.

(E) The sound a plant makes when it's not getting watered differs from the one it'll make when a leaf is cut. However, it's worth noting that experts don't think plants are crying out in pain.

231134

(A) They all possessed flaws, and all were subject to change and decayed with time.

(B) So how can we talk about perfect circles if we cannot actually see or touch them?

(C) He asked the question, what is a circle?

(D) However, Plato would point out that, if you looked closely enough, you would see that neither it, nor indeed any physical circle, was perfect.

(E) Plato's realism includes all aspects of experience but is most easily explained by considering the nature of mathematical and geometrical objects such as circles.

(F) Plato's extraordinary answer was that the world we see is a poor reflection of a deeper unseen reality of Forms, or universals, where perfect cats chase perfect mice in perfect circles around perfect rocks.

(G) Plato believed that the Forms or universals are the true reality that exists in an invisible but perfect world beyond our senses.

(H) You might indicate a particular example carved into stone or drawn in the sand.

250336

(A) For us to be able to say that an animal has concepts, we have to show not just that she's capable of thinking, but also that she has certain specific abilities.

(B) We can imagine, for instance, a squirrel who is planning how to get from the branch she's currently standing on to a branch from the tree in front.

(C) This doesn't imply that squirrels lack concepts, simply that they don't need them for this concrete form of thinking.

(D) To do this, in principle she doesn't need a concept of branch nor a concept of tree.

(E) Let's assume that at least some animals are capable of thinking despite lacking a language.

(F) This doesn't necessarily mean that they possess concepts, for some forms of thought may be nonconceptual.

(G) It might be enough for her to have, for example, the ability to think in images; to make a mental map of the tree where she can imagine and try out different routes.

250337

(A) When you shift your weight from your left leg to your right, the pressure on your left knee is released.

(B) The cartilage in your left knee then "drinks in" synovial fluid, in much the same way that a sponge soaks up liquid when put in water.

(C) Cartilage is extremely important for the healthy functioning of a joint, especially if that joint bears weight, like your knee.

(D) When you take another step and transfer the weight back onto your left leg, much of the fluid squeezes out of the cartilage.

(E) This squeezing of joint fluid into and out of the cartilage helps it respond to the off-and-on pressure of walking without breaking under the pressure.

(F) Imagine for a moment that you're looking into the inner workings of your left knee as you walk down the street.

250338

(A) And when they are ready, they figure out the conservation of volume for themselves just by playing with cups of water.

(B) Piaget argued that children's understanding of morality is like their understanding of those water glasses: we can't say that it is innate or kids learn it directly from adults.

(C) Piaget put the same amount of water into two different glasses: a tall narrow glass and a wide glass, then asked kids to compare two glasses.

(D) Rather, it is self-constructed as kids play with other kids.

(E) Taking turns in a game is like pouring water back and forth between glasses.

(F) Once kids have reached the age of five or six, then playing games and working things out together will help them learn about fairness far more effectively than any teaching from adults.

(G) Kids younger than six or seven usually say that the tall narrow glass now holds more water, because the level is higher.

250339

(A) The rise of air-conditioning accelerated the construction of sealed boxes, where the building's only airflow is through the filtered ducts of the air-conditioning unit.

(B) Anyone who has ever spent a few minutes in a mudbrick house in Tucson, or walked on the narrow streets of old Seville, knows how well these construction methods work.

(C) They built with thick walls and white roofs and transoms over doors to encourage airflow.

(D) They oriented buildings to capture cool breezes and block the worst heat of the afternoon.

(E) Architects understood the importance of shade, airflow, light colors.

(F) Look at any old building in a hot climate, whether it's in Sicily or Marrakesh or Tehran.

(G) But all this wisdom about how to deal with heat, accumulated over centuries of practical experience, is all too often ignored.

(H) In this sense, air-conditioning is not just a technology of personal comfort; it is also a technology of forgetting.

(I) It doesn't have to be this way.

250340

(A) Such logical thinking is a linear type of process, which uses our reasoning skills.

(B) On the other hand, creativity by definition involves the application of new information to old problems and the conception of new viewpoints and ideas.

(C) However, when we need to deal with new information, ideas, and viewpoints, linear thinking will often come up short.

(D) Stated differently, if you think in a linear manner, you'll tend to be conservative and keep coming up with techniques which are already known.

(E) In the course of trying to solve a problem with an invention, you may encounter a brick wall of resistance when you try to think your way logically through the problem.

(F) This, of course, is just what you don't want.

(G) For this you will be most effective if you learn to operate in a nonlinear manner; that is, use your creative brain.

(H) This works fine when we're operating in the area of what we know or have experienced.

The survey Klara has successfully completed is clear evidence that she is already well on her way to understanding all of Josie's drives and desires. You believe that there is something unreachable inside each of us, something that is unique and won't transfer. But there is nothing like that. The new Josie won't be an imitation.

(C) Learn Josie, not just superficially, but deeply, entirely. You have to continue her for Chrissie and for everyone else who loves Josie. Chrissie: I have doubts. I'm still not sure if this whole plan is the best thing we can do. I have been afraid of losing Josie ever since I lost Sal.

아래 주어진 문장 다음에 이어질 문장들의 적절한 순서를 쓰시오.

Josie's health took a turn for the worse after she returned from the city.

(A) Please send Josie the special nourishment she so desperately requires as you did that day to the homeless man. The Sun was then sinking into the ground, but Klara could tell he was smiling at her as he went down for his nightly rest. Out of gratitude and respect, Klara continued to look at the Sun until his last light vanished into the ground.

(B) Klara: You must be so tired, and I'm very sorry to disturb you, but I have come here this evening to ask a special favor. I have never forgotten how strong your power to restore everything is. Josie is becoming weaker and weaker each day.

(C) This made Klara determined to do everything she could for Josie. Klara remembered the barn into which the Sun had disappeared when she and Josie had been watching the sunset in Josie's room. Believing it to be the Sun's resting place, Klara visited there to pray to the Sun for Josie's recovery.

교과서4과 본문7

아래 주어진 문장 다음에 이어질 문장들의 적절한 순서를 쓰시오.

After several rainy days, the Sun came out to shine light on Josie and her whole bed.

(A) Mr. Capaldi believed there was nothing special inside Josie, but I believe now that there was something very special. But it wasn't inside Josie. It was inside those who loved her. I would have never reached what they felt for Josie in their hearts. I am sure of this now.

(B) I did all I could to learn Josie and to do what was best for her. If it had become necessary, I could have continued Josie. But I don't think it would have worked out so well. Not because I wouldn't have achieved accuracy, but however hard I tried, I believe now there would have remained something beyond my reach.

(C) Josie woke up and made a miraculous recovery. Seasons and years went by, and she grew into a healthy adult. When Josie left for college, Klara was sent to the Yard, a place where old AFs spend their remaining days at the end of their lives. In the Yard, she remembered her days with Josie. Klara: Josie was the best teenager for me.

They found that plants produce a high-frequency clicking noise when stressed and can make different sounds for different stressors.

Plants can communicate, although not in the same way we do. (①) Some express their discontent through scents. You know that smell that hangs in the air after you've mowed the lawn? Yeah, that's actually an SOS. Some plants use sound. Yes, sound, though at a frequency that we can't hear. (②) Researchers experimented with plants and microphones to see if they could record any trouble calls. (③) The sound a plant makes when it's not getting watered differs from the one it'll make when a leaf is cut. However, it's worth noting that experts don't think plants are crying out in pain. It's more likely that these reactions are kneejerk survival actions. (④) Plants are living organisms, and their main objective is to survive. (⑤) Scents and sounds are their tools for defending against things that might harm them.

We can imagine, for instance, a squirrel who is planning how to get from the branch she's currently standing on to a branch from the tree in front.

Let's assume that at least some animals are capable of thinking despite lacking a language. (①) This doesn't necessarily mean that they possess concepts, for some forms of thought may be nonconceptual. (②) To do this, in principle she doesn't need a concept of branch nor a concept of tree. (③) It might be enough for her to have, for example, the ability to think in images; to make a mental map of the tree where she can imagine and try out different routes. (④) This doesn't imply that squirrels lack concepts, simply that they don't need them for this concrete form of thinking. (⑤) For us to be able to say that an animal has concepts, we have to show not just that she's capable of thinking, but also that she has certain specific abilities.

When you take another step and transfer the weight back onto your left leg, much of the fluid squeezes out of the cartilage.

Cartilage is extremely important for the healthy functioning of a joint, especially if that joint bears weight, like your knee. (①) Imagine for a moment that you're looking into the inner workings of your left knee as you walk down the street. (②) When you shift your weight from your left leg to your right, the pressure on your left knee is released. (③) The cartilage in your left knee then "drinks in" synovial fluid, in much the same way that a sponge soaks up liquid when put in water. (④) This squeezing of joint fluid into and out of the cartilage helps it respond to the off-and-on pressure of walking without breaking under the pressure. (⑤)

Piaget put the same amount of water into two different glasses: a tall narrow glass and a wide glass, then asked kids to compare two glasses.

(A) Piaget argued that children's understanding of morality is like their understanding of those water glasses: we can't say that it is innate or kids learn it directly from adults. Rather, it is self-constructed as kids play with other kids.

(B) Taking turns in a game is like pouring water back and forth between glasses. Once kids have reached the age of five or six, then playing games and working things out together will help them learn about fairness far more effectively than any teaching from adults.

(C) Kids younger than six or seven usually say that the tall narrow glass now holds more water, because the level is higher. And when they are ready, they figure out the conservation of volume for themselves just by playing with cups of water.

아래 주어진 문장 다음에 이어질 문장들의 적절한 순서를 쓰시오.

The rise of air-conditioning accelerated the construction of sealed boxes, where the building's only airflow is through the filtered ducts of the air-conditioning unit.

(A) Anyone who has ever spent a few minutes in a mudbrick house in Tucson, or walked on the narrow streets of old Seville, knows how well these construction methods work. But all this wisdom about how to deal with heat, accumulated over centuries of practical experience, is all too often ignored. In this sense, air-conditioning is not just a technology of personal comfort; it is also a technology of forgetting.
(B) Architects understood the importance of shade, airflow, light colors. They oriented buildings to capture cool breezes and block the worst heat of the afternoon. They built with thick walls and white roofs and transoms over doors to encourage airflow.
(C) It doesn't have to be this way. Look at any old building in a hot climate, whether it's in Sicily or Marrakesh or Tehran.

Such logical thinking is a linear type of process, which uses our reasoning skills.

In the course of trying to solve a problem with an invention, you may encounter a brick wall of resistance when you try to think your way logically through the problem. (①) This works fine when we're operating in the area of what we know or have experienced. However, when we need to deal with new information, ideas, and viewpoints, linear thinking will often come up short. (②) On the other hand, creativity by definition involves the application of new information to old problems and the conception of new viewpoints and ideas. (③) For this you will be most effective if you learn to operate in a nonlinear manner; that is, use your creative brain. (④) Stated differently, if you think in a linear manner, you'll tend to be conservative and keep coming up with techniques which are already known. (⑤) This, of course, is just what you don't want.

For many people, ability refers to intellectual **c**_____, so they want everything they do to reflect how **s**_____ they are — writing a brilliant legal brief, getting the highest grade on a test, writing elegant computer code, saying something exceptionally wise or witty in a conversation. You could also **d** _____ ability **i**__ **t**_____ **o**__ a particular skill or talent, such as how well one plays the piano, learns a language, or serves a tennis ball. Some people **f**_____ **o**__ their ability to be **a**_____, entertaining, up on the latest trends, or to have the newest gadgets. **H**_____ ability may be **d** _____, a problem **o**_____ when it is the **s**_____ determinant of one's **s**_____. The performance becomes the only measure of the person; nothing else is **t** _____ into account. An outstanding performance means an outstanding person; an average performance means an average person. Period.

>> 내용요약

Defining ability solely by performance or **c**_____ can be **p**_____, as it **r**_____ a person's self-worth to their achievements, **i**_____ other qualities.

For many people, ability refers to intellectual **competence**, so they want everything they do to reflect how **smart** they are — writing a brilliant legal brief, getting the highest grade on a test, writing elegant computer code, saying something exceptionally wise or witty in a conversation. You could also **define** ability **in terms of** a particular skill or talent, such as how well one plays the piano, learns a language, or serves a tennis ball. Some people **focus on** their ability to be **attractive**, entertaining, up on the latest trends, or to have the newest gadgets. **However** ability may be **defined**, a problem **occurs** when it is the **sole** determinant of one's **self-worth**. The performance becomes the only measure of the person; nothing else is **taken** into account. An outstanding performance means an outstanding person; an average performance means an average person. Period.

>> 내용요약

Defining ability solely by performance or **competence** can be **problematic**, as it **reduces** a person's self-worth to their achievements, **ignoring** other qualities.

230935

Sensory nerves have **s**_____ endings in the tissues that pick up a particular sensation. If, for example, you step on a sharp object such as a pin, nerve endings in the skin will **t** _____ the pain sensation up your leg, up and along the spinal cord to the brain. While the pain itself is **u**_____, it is in fact acting as a **p**_____ mechanism for the foot. Within the brain, nerves will **c**_____ to the area that controls speech, so that you may well shout 'ouch' or something rather less polite. They will also **c**_____ to motor nerves that travel back down the spinal cord, and to the muscles in your leg that now **c**_____ quickly to lift your foot away from the painful object. Sensory and motor nerves **c**_____ almost all functions in the body — from the beating of the heart to the movement of the gut, sweating and just about everything else.

>> 내용요약

Sensory nerves **t**_____ specific sensations from specialized endings in tissues to the brain, triggering **p** _____ mechanism such as pain and muscle contractions, while also **c**_____ various bodily functions.

Sensory nerves have **specialized** endings in the tissues that pick up a particular sensation. If, for example, you step on a sharp object such as a pin, nerve endings in the skin will **transmit** the pain sensation up your leg, up and along the spinal cord to the brain. While the pain itself is **unpleasant**, it is in fact acting as a **protective** mechanism for the foot. Within the brain, nerves will **connect** to the area that controls speech, so that you may well shout 'ouch' or something rather less polite. They will also **connect** to motor nerves that travel back down the spinal cord, and to the muscles in your leg that now **contract** quickly to lift your foot away from the painful object. Sensory and motor nerves **control** almost all functions in the body — from the beating of the heart to the movement of the gut, sweating and just about everything else.

>> 내용요약

Sensory nerves **transmit** specific sensations from specialized endings in tissues to the brain, triggering **protective** mechanism such as pain and muscle contractions, while also **controlling** various bodily functions.

Claims that local food production **c**____ greenhouse gas emissions by **r**_____ the burning of transportation fuel are usually not well founded. Transport is the source of only 11 percent of greenhouse gas emissions within the food sector, so reducing the distance that food travels after it leaves the farm is far **l**____ important than reducing **w**_____ energy use on the farm. Food coming from a distance can actually be **b**_____ for the climate, depending on how it was grown. For example, field-grown tomatoes shipped from Mexico in the winter months will have a **s**_____ carbon footprint than local winter tomatoes grown in a greenhouse. In the United Kingdom, lamb meat that travels 11,000 miles from New Zealand generates only one-quarter the carbon emissions per pound compared to British lamb because farmers in the United Kingdom raise their animals on feed (which must be produced **u**_____ fossil fuels) rather than on clover pastureland. When food does travel, what matters most is not the **d**_____ traveled but the travel mode (surface versus air), and most of all the load size. Bulk loads of food can travel halfway around the world by ocean freight with a **s**_____ carbon footprint, per pound delivered, than foods traveling just a short distance but in much smaller loads. For example, 18-wheelers carry much **l**_____ loads than pickup trucks so they can move food 100 times as far while burning only one-third as much gas per pound of food delivered.

>> 내용요약

Food miles **m**_____ little since transport is only 11 percent; emissions depend on production, mode, and load size, so **i**_____ shipped in bulk can **o**_____ local.

Claims that local food production **cut** greenhouse gas emissions by **reducing** the burning of transportation fuel are usually not well founded. Transport is the source of only 11 percent of greenhouse gas emissions within the food sector, so reducing the distance that food travels after it leaves the farm is far **less** important than reducing **wasteful** energy use on the farm. Food coming from a distance can actually be **better** for the climate, depending on how it was grown. For example, field-grown tomatoes shipped from Mexico in the winter months will have a **smaller** carbon footprint than local winter tomatoes grown in a greenhouse. In the United Kingdom, lamb meat that travels 11,000 miles from New Zealand generates only one-quarter the carbon emissions per pound compared to British lamb because farmers in the United Kingdom raise their animals on feed (which must be produced **using** fossil fuels) rather than on clover pastureland. When food does travel, what matters most is not the **distance** traveled but the travel mode (surface versus air), and most of all the load size. Bulk loads of food can travel halfway around the world by ocean freight with a **smaller** carbon footprint, per pound delivered, than foods traveling just a short distance but in much smaller loads. For example, 18-wheelers carry much **larger** loads than pickup trucks so they can move food 100 times as far while burning only one-third as much gas per pound of food delivered.

>> 내용요약

Food miles **matter** little since transport is only 11 percent; emissions depend on production, mode, and load size, so **imports** shipped in bulk can **outperform** local.

Anthropologist Gregory Bateson suggests that we tend to understand the world by **f**_____ in on **p**_____ **f** _____ within it. Take platypuses. We might **z**_____ in so **c** _____ to their fur that each hair appears different. We might also zoom out to the extent where it appears as a single, **u** _____ object. We might take the platypus as an individual, or we might treat it as part of a larger unit such as a species or an ecosystem. It's possible to move between many of these **p** _____, although we may need some **a** _____ tools and skills to zoom in on individual pieces of hair or zoom out to **e**_____ ecosystems. Crucially, **h** _____, we can only take up one perspective at a time. We can pay attention to the **v**_____ behavior of individual animals, look at what **u**_____ them into a single species, or look at them as part of bigger ecological patterns. Every possible perspective involves **e**_____ certain aspects and **i** _____ others.

>> 내용요약

Anthropologist Gregory Bateson's concept suggests that our understanding of the world is shaped by the specific **p** _____ we adopt, exemplified by the various ways we can view a platypus - from microscopic details to ecosystem-wide contexts - emphasizing that while we can **s**_____ between different levels of focus, we can only hold one perspective at a time, inevitably **e**_____ certain aspects while **o**_____ others.

Anthropologist Gregory Bateson suggests that we tend to understand the world by **focusing** in on **particular features** within it. Take platypuses. We might **zoom** in so **closely** to their fur that each hair appears different. We might also zoom out to the extent where it appears as a single, **uniform** object. We might take the platypus as an individual, or we might treat it as part of a larger unit such as a species or an ecosystem. It's possible to move between many of these **perspectives**, although we may need some **additional** tools and skills to zoom in on individual pieces of hair or zoom out to **entire** ecosystems. Crucially, **however**, we can only take up one perspective at a time. We can pay attention to the **varied** behavior of individual animals, look at what **unites** them into a single species, or look at them as part of bigger ecological patterns. Every possible perspective involves **emphasizing** certain aspects and **ignoring** others.

>> 내용요약

Anthropologist Gregory Bateson's concept suggests that our understanding of the world is shaped by the specific **perspectives** we adopt, exemplified by the various ways we can view a platypus - from microscopic details to ecosystem-wide contexts - emphasizing that while we can **shift** between different levels of focus, we can only hold one perspective at a time, inevitably **empahsizing** certain aspects while **overlooking** others.

231134

Plato's realism includes all aspects of experience but is most easily **e**_____ by **c**_____ the nature of **m**_____ and **g**_____ objects such as circles. He asked the question, what is a circle? You might indicate a particular example **c**_____ into stone or **d**_____ in the sand. **H**_____, Plato would point out that, if you looked closely enough, you would see that neither it, nor indeed any physical circle, was **p**_____. They all possessed **f**_____, and all were **s**_____ to change and **d**_____ with time. So how can we talk about perfect circles if we cannot actually see or touch them? Plato's **e**_____ answer was that the world we see is a **p**____ **r**_____ of a deeper **u**_____ reality of Forms, or universals, where perfect cats chase perfect mice in perfect circles around perfect rocks. Plato believed that the Forms or universals are the true reality that exists in an **i**_____ but **p**_____ world beyond our senses.

>> 내용요약

Plato's philosophical **r**_____, best illustrated through mathematical and geometrical concepts like circles, posits that the **i**_____ physical world we perceive is merely a **f**_____ reflection of a higher, **u**_____ reality of perfect Forms or universals, which exist in an **i**_____ realm beyond our senses and represent the true nature of reality.

Plato's realism includes all aspects of experience but is most easily **explained** by **considering** the nature of **mathematical** and **geometrical** objects such as circles. He asked the question, what is a circle? You might indicate a particular example **carved** into stone or **drawn** in the sand. **However**, Plato would point out that, if you looked closely enough, you would see that neither it, nor indeed any physical circle, was **perfect**. They all possessed **flaws**, and all were **subject** to change and **decayed** with time. So how can we talk about perfect circles if we cannot actually see or touch them? Plato's **extraordinary** answer was that the world we see is a **poor reflection** of a deeper **unseen** reality of Forms, or universals, where perfect cats chase perfect mice in perfect circles around perfect rocks. Plato believed that the Forms or universals are the true reality that exists in an **invisible** but **perfect** world beyond our senses.

>> 내용요약

Plato's philosophical **realism**, best illustrated through mathematical and geometrical concepts like circles, posits that the **imperfect** physical world we perceive is merely a **flawed** reflection of a higher, **unseen** reality of perfect Forms or universals, which exist in an **invisible** realm beyond our senses and represent the true nature of reality.

Cartilage is extremely **i**_____ for the healthy functioning of a joint, especially if that joint **b**_____ weight, like your knee. Imagine for a moment that you're looking into the inner workings of your left knee as you walk down the street. When you shift your weight from your left leg to your right, the pressure on your left knee is **r**_____. The cartilage in your left knee then "**d**_____ **i**___" synovial fluid, in much the same way that a sponge **s**_____ **u**___ liquid when put in water. When you take another step and **t**_____ the weight back onto your left leg, much of the fluid squeezes **o**____ **o**___ the cartilage. This **s**_____ of joint fluid into and out of the cartilage helps it respond to the off-and-on pressure of walking without **b**_____ under the pressure.

>> 내용요약

Cartilage **a**_____ and **r**_____ synovial fluid like a sponge to **h**_____ shifting pressure during walking, helping joints function **s**_____ without damage.

Cartilage is extremely **important** for the healthy functioning of a joint, especially if that joint **bears** weight, like your knee. Imagine for a moment that you're looking into the inner workings of your left knee as you walk down the street. When you shift your weight from your left leg to your right, the pressure on your left knee is **released**. The cartilage in your left knee then "**drinks in**" synovial fluid, in much the same way that a sponge **soaks up** liquid when put in water. When you take another step and **transfer** the weight back onto your left leg, much of the fluid squeezes **out of** the cartilage. This **squeezing** of joint fluid into and out of the cartilage helps it respond to the off-and-on pressure of walking without **breaking** under the pressure.

>> 내용요약

Cartilage **absorbs** and **releases** synovial fluid like a sponge to **handle** shifting pressure during walking, helping joints function **smoothly** without damage.

250338

Piaget put the **s**_____ amount of water into two different glasses: a tall narrow glass and a wide glass, then asked kids **t** ___ **c**_____ two glasses. Kids younger than six or seven usually say that the tall narrow glass now holds **m**_____ water, because the level is **h**_____. And when they are ready, they figure out the **c**_____ of volume for themselves just by **p**_____ with cups of water. Piaget argued that children's understanding of **m**_____ is like their understanding of **t** _____ **w**_____ **g**_____: we can't say that it is **i**_____ or kids learn it **d**_____ from adults. Rather, it is **s** _____ as kids play with other kids. **T** _____ **t**_____ in a game is like pouring water back and forth between glasses. Once kids have reached the age of five or six, then playing games and working things out together will help them learn about **f**_____ far more effectively than any teaching from adults.

>> 내용요약

Piaget showed that young children think a taller glass **h**_____ more water, even when the **s**_____ amount is used, because the level appears **h**_____. Over time, they discover **c** _____ by playing with water. Piaget believed that children understand **m**_____ in a similar way—not as something **i**_____ or learned directly, but as **s** _____ through interaction. Taking turns in games, like pouring water between glasses, helps children around age five or six learn about **f**_____ more effectively than adult **i**_____.

Piaget put the **same** amount of water into two different glasses: a tall narrow glass and a wide glass, then asked kids **to compare** two glasses. Kids younger than six or seven usually say that the tall narrow glass now holds **more** water, because the level is **higher**. And when they are ready, they figure out the **conservation** of volume for themselves just by **playing** with cups of water. Piaget argued that children's understanding of **morality** is like their understanding of **those water glasses**: we can't say that it is **innate** or kids learn it **directly** from adults. Rather, it is **self-constructed** as kids play with other kids. **Taking turns** in a game is like pouring water back and forth between glasses. Once kids have reached the age of five or six, then playing games and working things out together will help them learn about **fairness** far more effectively than any teaching from adults.

>> 내용요약

Piaget showed that young children think a taller glass **holds** more water, even when the **same** amount is used, because the level appears **higher**. Over time, they discover **conservation** by playing with water. Piaget believed that children understand **morality** in a similar way—not as something **innate** or learned directly, but as **self-constructed** through interaction. Taking turns in games, like pouring water between glasses, helps children around age five or six learn about **fairness** more effectively than adult **instruction**.

The rise of air-conditioning **a**_____ the construction of sealed boxes, where the building's only airflow is through the filtered ducts of the air-conditioning unit. It doesn't have to be this way. Look at any old building in a hot climate, whether it's in Sicily or Marrakesh or Tehran. Architects understood the **i**_____ of shade, airflow, light colors. They oriented buildings to **c**_____ cool breezes and block the worst heat of the afternoon. They built with thick walls and white roofs and transoms over doors to **e**_____ airflow. Anyone who has ever spent a few minutes in a mudbrick house in Tucson, or walked on the narrow streets of old Seville, knows how well these construction methods **w**_____. But all this wisdom about how to **d**_____ **w**_____ heat, **a**_____ over centuries of practical experience, is all too often **i**_____. In this sense, air-conditioning is not just a technology of personal comfort; it is also a technology of **f**_____.

>> 내용요약

By **p**_____ sealed boxes, air conditioning has led us to **f**_____ centuries of proven passive cooling design that **h**_____ shade, airflow, building orientation, light colors, and thick walls to **m**_____ heat.

The rise of air-conditioning **accelerated** the construction of sealed boxes, where the building's only airflow is through the filtered ducts of the air-conditioning unit. It doesn't have to be this way. Look at any old building in a hot climate, whether it's in Sicily or Marrakesh or Tehran. Architects understood the **importance** of shade, airflow, light colors. They oriented buildings to **capture** cool breezes and block the worst heat of the afternoon. They built with thick walls and white roofs and transoms over doors to **encourage** airflow. Anyone who has ever spent a few minutes in a mudbrick house in Tucson, or walked on the narrow streets of old Seville, knows how well these construction methods **work**. But all this wisdom about how to **deal with** heat, **accumulated** over centuries of practical experience, is all too often **ignored**. In this sense, air-conditioning is not just a technology of personal comfort; it is also a technology of **forgetting**.

>> 내용요약

By **promoting** sealed boxes, air conditioning has led us to **forget** centuries of proven passive cooling design that **harnessed** shade, airflow, building orientation, light colors, and thick walls to **manage** heat.

In the course of trying to solve a problem with an **i**_____ , you may encounter a brick wall of **r**_____ when you try to think your way **l**_____ through the problem. Such **l**_____ thinking is a **l**_____ type of process, which uses our **r**_____ skills. This works fine when we're operating in the area of what we **k**_____ or have **e**_____. However, when we need to **d**_____ **w**_____ new information, **i**_____, and viewpoints, linear thinking will often come up **s**_____. On the other hand, creativity **b**___ **d**_____ involves the **a**_____ of new information to old problems and the conception of new viewpoints and ideas. For this you will be most **e**_____ if you learn to operate in a **n**_____ manner; that is, use your **c**_____ brain. Stated differently, if you think in a **l**_____ **m**_____, you'll tend to be **c**_____ and keep coming up with techniques which **a**____ already **k**_____. This, of course, is just what you don't want.

>> 내용요약

L_____ thinking works well with **f**_____ problems but falls short in dealing with **n**____ ideas, for which creative thinking is needed to come up with innovative solutions.

In the course of trying to solve a problem with an **invention**, you may encounter a brick wall of **resistance** when you try to think your way **logically** through the problem. Such **logical** thinking is a **linear** type of process, which uses our **reasoning** skills. This works fine when we're operating in the area of what we **know** or have **experienced**. However, when we need to **deal with** new information, **ideas**, and viewpoints, linear thinking will often come up **short**. On the other hand, creativity **by definition** involves the **application** of new information to old problems and the conception of new viewpoints and ideas. For this you will be most **effective** if you learn to operate in a **nonlinear** manner; that is, use your **creative** brain. Stated differently, if you think in a **linear manner**, you'll tend to be **conservative** and keep coming up with techniques which **are** already **known**. This, of course, is just what you don't want.

>> 내용요약

Logical thinking works well with **familiar** problems but falls short in dealing with **new** ideas, for which creative thinking is needed to come up with innovative solutions.
