1. 빈칸 (A)~(K)에 들어갈 단어를 〈Word Box〉에서 제시하였다. 이 중 어느 빈칸에도 들어갈 수 없는 단어만 묶인 것은? [2.8점]

- A good (A) _____ will overcome hardship and show strong character development.
- The dog and the gray wolf originally (B) _____d from the same ancestor.
- They will meet tomorrow with their (C) _____ lawyers to finalize the details.
- She lay on her back and watched the clouds (D) _____ by.
- Users want their products to be (E) _____ and strong.
- We feel guilty when our conduct (F) _____s moral principles.
- After years of continuous hard rain, much of the soil had (G) _____d.
- A large (H) _____ of agricultural land was left uncultivated.
- She was (I) _____ enough to forgive their repeated mistakes.
- The company has (J) _____ed him access to its database.
- Buyers are (K) _____ until the price of smartphones falls.

<Word Box>

execute	durable	diverge	gracious
proportion	foremost	respective	favorable
drift	hold off	aural	violate
protagonist	excel	erode	grant

① execute, foremost, excel, respective, drift
② execute, foremost, aural, excel, favorable
③ aural, favorable, foremost, respective, gracious
④ execute, aural, excel, drift, gracious
⑤ favorable, excel, aural, respective, drift

2. 보기의 (A)~(I) 중 밑줄 친 단어의 동의어가 문맥상 적절하지 않은 것끼리 짝 묶은 것은? [2.8점]

(A) The manufacturer is [**liable**(=responsible)] for injuries caused by the product.
(B) People in [**subordinate**(=junior)] positions often play a crucial role in the success of organizations.
(C) Sartre argues that seeing ourselves from another's perspective always [**unnerves**(=exhausts)] us.
(D) Because information is so accessible and communication is [**instantaneous**(=immediate)], the value of acquiring information is reduced.
(E) The partners were utterly [**incompatible**(=unfamiliar)], so they ended their partnership.
(F) By the end of the Roman Imperium, Italy had been [**stripped**(=deprived)] of forest cover.
(G) She had no [**recollection**(=memory)] of visiting many places when she was younger.
(H) They tried to [**intimidate**(=persuade)] me, but I didn't care and ignored them.
(I) When you are making moral decisions, [**egocentric**(=self-centered)] strategies often go wrong.

① (A), (B), (D) ② (C), (F), (H) ③ (C), (E), (H)
④ (B), (F), (I) ⑤ (D), (G), (H)

[3~4] 다음 글의 주제로 가장 적절한 것을 고르시오. [각 2.8점씩]

3.

As individuals, our ability to thrive depended on how skillfully we handled relationships within a group. If the group valued us, we could rely on its support, a share of its resources, and probably a partner. If it didn't, we might lose all of these benefits. It was a matter of survival, both physical and genetic. Over millions of years, this pressure favored people who were sensitive to their position in the group and skilled at raising it. As a result, we developed a tendency to unconsciously check how other people in our community see us. We process that information in the form of self-esteem and related feelings such as pride, shame, or insecurity. These feelings push us to do more of what makes our community value us and less of what doesn't. And, crucially, they are designed to make that motivation feel as if it comes from within. If we were aware that we were simply responding to social pressure, our behavior might look reluctant or insincere, making it less convincing.

① how group living made individuals more dependent on one another
② why people with high self-esteem sound more convincing to others
③ self-esteem as an inner signal of our social standing
④ the need to hide our true motives from the people around us
⑤ how social pressure makes our behavior look reluctant and insincere

4.

Literary works, by their nature, suggest rather than explain; they hint at their claims rather than state them boldly and directly. This broad generalization, however, does not mean that works of literature never include direct statements. Depending on when they were written and by whom, literary works may contain a great deal of direct telling and relatively little suggestion. But whatever the balance between showing and telling in a work, there is always something left for readers to interpret. That is why readers ask, "What does the text suggest?" as a starting point for interpretation and for thinking about what a text implies. What a text implies often fascinates us, and our effort to figure out those implications tests our analytical powers. In considering what a text suggests, we become more practiced at making sense of texts.

① why literary works rarely contain direct statements
② why writers should balance showing and telling in their works
③ the key differences between literary texts and everyday writing
④ how analytical skills help readers judge the quality of literature
⑤ uncovering what is left unsaid as the heart of reading literature

5. 다음 글의 제목으로 가장 적절한 것은? [2.8점]

There is a lot of scientific evidence showing that focused attention leads to the reshaping of the brain. In animals rewarded for detecting sound (to hunt or to avoid being hunted, for example), we find much larger hearing centers in the brain. Likewise, animals that depend on sharp eyesight have enlarged visual areas. Brain scans of violinists provide more evidence, revealing remarkable growth in the regions of the cortex linked to the left hand, which must press the strings accurately, often at very high speed. Other studies have found that taxi drivers have an enlarged hippocampus, a part of the brain vital for remembering places.

* hippocampus: 해마 ** cortex: (대뇌) 피질

① Musicians' Brains: Shaped by Talent, Not Training
② Where Your Focus Goes, Your Brain Follows
③ Born Different: Why Some Brains Grow Larger Than Others
④ The Hippocampus: A Built-in Map for Taxi Drivers
⑤ Can Brain Scans Reveal What We Are Thinking?

6. 다음 글의 (A)~(E)에 대한 설명으로 올바르지 <u>않은</u> 것을 모두 고르시오. [2.8점]

Anthropologist Gregory Bateson argues that we tend to make sense of the world by concentrating on (A) **<u>particular features</u>** within it. Consider the platypus. We might look so closely at its fur that each hair seems different from the others. Or we might step back until the animal appears as a single, uniform object. We might view the platypus as an individual, or we might see it as part of a larger unit such as a species or an ecosystem. We can shift between many of (B) **<u>these perspectives</u>**, though we may need (C) **<u>additional tools and skills</u>** to examine single hairs or to take in entire ecosystems. Crucially, however, we can adopt only (D) **<u>one perspective at a time</u>**. We can focus on how individual animals behave differently, look at what unites them into one species, or view them as part of bigger ecological patterns. Every possible perspective involves highlighting (E) **<u>certain aspects</u>** while ignoring others.

* platypus: 오리너구리

① (A) refers to the specific parts of the world that we choose to concentrate on.
② (B) refers to viewing the platypus at different levels, from a single hair to a whole ecosystem.
③ (C) refers to the extra help we may need to look at the smallest or the largest scales.
④ (D) means that we should pick the single most useful perspective and stay with it.
⑤ (E) means the aspects that are left out while the others are highlighted.

[7~8] 다음 질문에 대한 답으로 가장 적절한 것을 고르시오. [각 2.8점씩]

7.

Every beech tree grows in its own spot, and soil conditions can change greatly within just a few yards. Some soil holds plenty of water while other soil is almost dry; some is rich in nutrients and some is not. So each tree grows faster or slower and makes more or less sugar in total, and you would therefore expect each tree to photosynthesize at its own rate. Surprisingly, however, the rate is the same. Whether thick or thin, all the trees of the same species use light to produce the same amount of sugar per leaf. Some trees have plenty of sugar and others have less, but they balance out this difference by passing sugar to one another. This exchange happens underground, through the roots. Trees with extra sugar hand some over, and those running short receive help. Their network works as a system that keeps any tree from falling too far behind.

Q. What can be inferred from the passage?

① A tree's sugar supply does not depend only on the soil in which it grows.
② Beech trees in water-rich soil photosynthesize faster than those in dry soil.
③ Trees that make little sugar stop photosynthesizing and rely entirely on their neighbors.
④ Beech trees share their sugar only with trees of a similar thickness.
⑤ Every beech tree ends up with exactly the same amount of sugar because the soil is similar.

8.

People who perform at a high level in their profession often gain instant credibility with others. They earn our admiration, we wish to be like them, and we feel a bond with them. When they speak, others pay attention — even when their area of skill has nothing to do with the advice they are giving. Consider a world-famous basketball player who has earned more money from advertising products than he ever did from playing basketball. Is that because he knows a lot about the products he promotes? No. It is because of what he can do with a basketball. The same is true of an Olympic gold medalist in swimming; people listen to him because of what he can do in the pool. And when an actor tells us to drive a certain car, we don't listen because he understands engines. We listen because we admire his talent. Excellence connects. In other words, if you are truly skilled in one field, that skill alone can draw people to you.

Q. Which of the following <u>cannot be inferred</u> from the passage?

① A famous athlete's advice on a product may be accepted even if he knows little about it.
② Much of a top athlete's income may come from outside the sport itself.
③ People believe advertisements by famous athletes and actors mainly because they think those people have tried the products.
④ Advertisers may choose celebrities partly because audiences admire their talent.
⑤ People admired for one talent may be trusted even when they talk about unrelated things.

9. 다음 중 지문 내용을 바탕으로 추론할 수 <u>없는</u> 내용은? [2.8점]

In one study, a researcher posing as a volunteer went door to door in a California neighborhood, asking residents whether they would let a large sign reading "Drive Carefully" be put up on their front lawns. To show them what it would look like, he showed them a photo of the huge sign hiding the view of a lovely house. Not surprisingly, most people said no, but in one particular group, an amazing 76 percent agreed. Why? Two weeks earlier, another volunteer had asked these residents to make a small commitment: to place a tiny sign that said "Be a Safe Driver" in their windows. Because the request was so small and easy, almost all of them accepted it. Surprisingly, that small first commitment had a strong effect on their willingness to accept a much bigger request two weeks later.

① A bookstore first asks shoppers to recommend one book on a small card. Later, it asks them to write a full review for its website. Those who filled out the card are more likely to write the review than those who were not asked.
② A charity first asks people to give one dollar. Later, it asks them for a much larger gift. Those who gave the dollar are more likely to give the larger gift than those who were not asked.
③ A teacher first asks some of her students to tidy their own desks. Later, she asks the whole class to clean the classroom. Those who tidied their desks are more likely to help clean it than those who were not asked.
④ A company first asks customers to answer one short question. Later, it asks them to fill out a long survey. Those who answered the question are less likely to fill out the survey than those who were not asked.
⑤ A gym first asks visitors to exercise for just ten minutes. Later, it asks them to join a two-hour class. Those who exercised for ten minutes are more likely to join the class than those who were not asked.

[10~13] 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 <u>않은</u> 것을 고르시오. [각 2.8점씩]

10.

If you want the confidence that comes from accomplishing what you set out to do each day, you need to understand how long things will actually take. Being too ①**<u>optimistic</u>** about what can be done within a given time frame is a common problem, so work on it. Get into the habit of ②**<u>estimating</u>** the time each item on your to-do list will require, and learn from experience which tasks take more or less time than you expected. Pay attention, too, to ③**<u>matching</u>** each task to the time available. Some tasks can only be started when you have a ④**<u>substantial</u>** block of time. It is ⑤**<u>worthwhile</u>** to start such a task when only a short period is free. So set aside the time you need for longer tasks, and fit the shorter ones into the spare moments in between.

11.

As businesses shift some core activities to digital platforms, such as sales, marketing, or archiving, it is assumed that the impact on the environment will be less negative. Digital business, however, can still ①**<u>endanger</u>** the environment, and in some cases its damage may be even more serious. A few decades ago, offices used to have much more paper waste since all documents were paper based. When workplaces switched from paper to digital documents, invoices, and emails, it seemed a ②**<u>promising</u>** step toward saving trees. Yet the environmental cost of the Internet and electricity tends to be ③**<u>exaggerated</u>**. A recent report stated that most data centers are still ④**<u>dependent</u>** on fossil fuels for energy. As we store ever larger amounts of data in the cloud, the resulting carbon emissions turn our green clouds gray. An email has a smaller carbon footprint than a letter sent by post, but it still ⑤**<u>emits</u>** about four grams of CO_2, and a large attachment can raise that to 50 grams.

12.

The brain of an adolescent does not fully develop until its early twenties. What this means is that the way in which teenagers' decision-making circuits bring together and process information may leave them in an ①**unfavorable** position when they have to make choices. Among the last parts of their brain to mature is the prefrontal cortex*, which serves as the control center and is given the task of thinking ahead and evaluating the consequences of actions. It is this area of the brain that ②**stops** you from sending off an initial angry text and has you modify it with kinder words before it reaches your friend. The limbic system**, on the other hand, which plays a ③**major** role when it comes to processing our emotional responses, matures earlier than the prefrontal cortex does. Its earlier development makes it more likely to influence decision-making. As a result, when the adolescent brain has to make a decision, emotional factors tend to play a greater role in leading the process than the perception of what the consequences will be. Due to these differences, there is an imbalance between feeling-based decision-making, in which the more advanced limbic system is ④**restrained**, and logic-based decision-making by the not-yet-mature prefrontal cortex. It is this imbalance between the two regions of the brain, then, that may help to explain why some teens are more prone to making ⑤ **inappropriate** decisions without thinking them through.

* prefrontal cortex: 전전두엽 피질 ** limbic system: 대뇌변연계

13.

To be successful, you need to understand the vital difference between believing that you will succeed and believing that you will reach your goals ①**effortlessly**, as if success were simply waiting for you. Put another way, it is the ②**distinction** between being a realistic optimist and being an unrealistic one, even though people in both groups share the same hope of reaching their goals. People in the former group are convinced that they will succeed, yet they also feel it is up to them to bring success about through things like careful planning and choosing the right strategies. They recognize that the question of how they will deal with the obstacles in their path is one that calls for ③**careless** consideration before they actually set to work. This kind of preparation only ④**strengthens** their confidence in their own ability to get things done, no matter how many difficulties they may run into along the way. The latter, by contrast, believe that success will simply happen to them, trusting that the universe will reward them for all their positive thinking. Or else they believe that they will somehow be transformed overnight into the kind of person for whom all obstacles have ⑤**disappeared** from the road ahead.

[14~15] 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오. [각 2.8점씩]

14.

Plato's realism covers every aspect of experience, but it is most easily explained by looking at the nature of mathematical and geometrical objects such as circles. He asked a simple question: what is a circle? You might point to a particular one carved into stone or drawn in the sand. Plato, however, would argue that if you examined it closely enough, you would find that neither it nor any other physical circle was perfect. All of them had flaws, and all of them changed and wore away over time. If no perfect circle can ever be seen or touched, how is it possible to speak of one at all? Plato's remarkable answer was that the world we see is _____. For Plato, the true reality lies in Forms, or universals, where perfect cats chase perfect mice in perfect circles around perfect rocks, existing in an invisible world beyond our senses.

* universal: 보편자

① the only reality that we can fully trust and measure
② a place where perfect circles can be found if we look closely enough
③ an imperfect world that human reason can gradually make perfect
④ only an imperfect copy of a perfect world that we cannot see
⑤ a world of perfect Forms that our senses can directly grasp

15.

Suppose that at least some animals can think even though they have no language. This does not necessarily mean that they have concepts, because certain kinds of thought may not involve concepts at all. Imagine, for example, a squirrel working out how to get from the branch she is standing on to a branch of the tree in front of her. In principle, she needs neither a concept of branch nor a concept of tree to do this. It might be enough for her to think in images, that is, to build a mental map of the tree on which she can picture and test different routes. This does not mean that squirrels have no concepts; it simply means that they do not need them for this concrete kind of thinking. So, to be able to say that an animal has concepts, we must show _____.

① that it can do a kind of thinking that images alone cannot support
② that it can plan a route without the help of any language
③ that it can form mental images of its surroundings
④ that it can solve problems it has never faced before
⑤ that it can link its thoughts to spoken sounds

16. 다음 글에서 전체 흐름과 관계 없는 문장은? [2.8점]

The price we pay for interruptions has been well recorded. ① Martin Luther King Jr. expressed his regret over them when he spoke of "that lovely poem that didn't get written because someone knocked on the door." ② Many writers keep a notebook by their bed so that they can write down the ideas that come to them in their dreams. ③ Perhaps the best-known literary case occurred in 1797, when Samuel Taylor Coleridge began writing his poem Kubla Khan from a dream he had but was then visited by an unexpected guest. ④ The visitor happened to arrive at a particularly bad time; Coleridge lost his inspiration and left the work unfinished. ⑤ Such sudden disruptions have had serious consequences for people in critical roles such as doctors, nurses, and pilots, but they also affect most of us in our everyday lives, slowing down our work and raising our stress levels.

	대상	(1)학년 (1~13)반				

17. 다음 글의 내용과 일치하지 <u>않는</u> 것을 고르시오. [2.8점]

In a 1992 study at Princeton University, researchers examined two groups of mice. One group was made intellectually superior by altering the gene for the glutamate receptor; glutamate is a brain chemical that is essential for learning. The other group was made intellectually inferior through a change to the same gene. The smart mice were then kept in ordinary cages, while the inferior mice were raised in large cages full of toys and exercise wheels, with plenty of social contact. By the end of the study, the less intelligent mice, despite their genetic handicap, were able to perform just as well as their genetically gifted peers. This was a real triumph for nurture over nature. Whether genes are turned on or off depends on what is around you.

* glutamate receptor: 글루타민산염 수용체

① The researchers changed the same gene in both groups of mice.
② The genetically superior mice were kept in ordinary cages.
③ The genetically inferior mice lived in ordinary cages with few toys and little social contact.
④ By the end of the study, the genetically inferior mice performed as well as the superior mice.
⑤ The study suggests that surroundings can affect whether genes are turned on or off.

[18~19] 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳을 고르시오. [각 2.8점씩]

18.

This is why every true artist creates not from a busy mind but from a place of inner stillness.

The mind is, at its core, a machine built for survival. (①) It excels at attacking and defending against other minds and at gathering, storing, and analyzing information, but it is not creative in the slightest. (②) Remarkably, the same appears to be true even of great scientists, many of whom have said that their creative breakthroughs came in moments of mental calm. (③) When a nationwide survey asked America's most famous scientists and mathematicians, including Einstein, how they worked, the surprising finding was that thinking "plays only a subordinate part in the brief, decisive phase of the creative act itself." (④) So the simple reason most scientists are not creative, I would argue, is not that they don't know how to think, but that they don't know how to stop thinking! (⑤)

19.

To deal with this problem, researchers have developed models for face aging and digital de-aging.

Despite the remarkable progress in deep-learning-based facial recognition in recent years, it still has limitations in terms of identification performance. (①) These limitations are tied to the database used in the learning stage. (②) If the selected database does not contain enough examples, the results may be systematically affected. (③) For instance, a facial recognition system may perform worse if the person to be identified was registered more than 10 years ago. (④) Over such a period, the texture of the face changes as wrinkles appear and the skin begins to sag, and these changes may be made even more noticeable by weight gain or loss. (⑤) These models make up for the differences in facial features that appear over a given period of time.

20. 다음 글의 내용을 아래와 같이 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은? [2.8점]

People often say that history repeats itself. Indeed, when we look at the historical records of ancient civilizations, certain things do seem to happen again and again. Civilizations grow, stretch themselves too far, and then fall, as Rome did in 476 AD and as the British Empire did more than a thousand years later, after World War II. But does it always happen this way? If it did, archaeology would be pretty boring, with one thing happening again and again. Some civilizations, however, come to a sudden end. The Aztec and Inca empires, for example, were conquered by invaders in the sixteenth century and never had the chance to collapse from overexpansion. So when it comes to civilizations, the saying that history repeats itself seems to be an oversimplification.

* archaeology: 고고학

⬇

<요약문> Although many civilizations seem to follow the same pattern of growing too large and then (A), the existence of civilizations that met a(n) (B) end shows that "history repeats itself" is too simple a view.

	(A)	(B)
①	falling apart	abrupt
②	falling apart	predictable
③	recovering	abrupt
④	expanding	gradual
⑤	recovering	predictable

21. 다음 글 [I]~[II]에서 답을 찾을 수 없는 질문은? [2.8점]

[I] You may have heard the old joke, "How do you eat an elephant?" The answer is "One bite at a time." Then how would you "build" the Earth? That's simple, too: one atom at a time. Atoms are the basic building blocks of crystals, and since rocks are made up of crystals, it pays to understand atoms. Crystals appear in a variety of shapes, which scientists call habits. Some of the most familiar habits are squares, triangles, and six-sided hexagons. Crystals usually form as liquids cool, just as water does when you make ice cubes. Often, however, they form under conditions that do not allow for perfect shapes. When it is too cold or too hot, or when there is not enough source material, crystals may grow into odd, twisted forms. When conditions are right, though, the results can be stunning. This usually requires a slow, steady environment in which each atom has plenty of time to join the others and fit neatly into what is called the crystal lattice, the basic arrangement of atoms that appears again and again.

[II] Minerals are formed by natural processes in many different ways. Magma, for example, is hot, melted rock material that cools when it reaches the Earth's surface, or even while it is still trapped below the surface. As it cools, its atoms lose heat energy, move closer to one another, and start to combine into compounds. In this process, the atoms of each compound arrange themselves into orderly, repeating patterns. Which minerals form depends partly on the type and amount of elements the magma contains. The size of the resulting crystals, on the other hand, depends partly on how quickly the magma cools. When it cools slowly, the crystals are usually large enough to be seen with the unaided eye, because the atoms have enough time to gather and build larger crystals. When it cools rapidly, the crystals stay small, and individual mineral crystals are hard to see.

* crystal lattice: 결정 격자

① At what temperature does magma begin to form crystals?
② What name do scientists give to the different shapes that crystals take?
③ What can cause crystals to grow into odd, twisted forms?
④ What do ice cubes and cooling magma have in common in the way crystals form?
⑤ Why do crystals grow larger when the cooling process is slow?

22. 다음 글 [I]-[II]를 읽고 이해한 내용으로 적절하지 않은 2개는? [2.8점]

[I] Managers are always looking for ways to raise productivity, the amount a business produces compared with what it spends. Adam Smith, writing when the manufacturing industry was still new, described a way that production could be made more efficient, which he called the "division of labor." Making most manufactured goods involves several different processes, each requiring a different skill. Smith's example was the manufacture of pins: the wire is straightened and sharpened, a head is added, and finally the pin is polished. A single worker could carry out all of these tasks and make about 20 pins in a day. But the job can be broken down into its separate processes, with each of several workers handling only one of them. Because each worker specializes in a single task, he or she can work much faster, without losing time changing from one task to another. As a result, 10 workers can now produce thousands of pins in a day, a huge increase from the 200 they would have made before.

[II] In the Old Stone Age, people lived in small bands of 20 to 60 and wandered from place to place in search of food. Farming changed this: once people began to grow crops, they could settle down near their farms, and towns and villages grew larger. Living in communities let people organize themselves more efficiently, because the work of producing food and other necessities could be shared out. While some villagers grew crops, others built new houses or made tools. People also discovered that they could finish a task faster by cooperating. Toolmakers, for example, might split up the work of making stone axes and knives, and by working as a team, they could turn out more tools in the same amount of time.

① [I] Splitting pin-making into separate steps saves the time a worker would lose moving between tasks.
② [I] Without the division of labor, ten workers together would make only about 200 pins a day.
③ [I] Smith's workers became faster mainly because each of them used better tools.
④ [II] Settling near farms led to larger communities, which in turn made it possible to share out work.
⑤ [II] Toolmakers had already begun sharing their work while people were still moving in search of food.

23. 다음 글 [I]~[II]의 빈칸에 들어갈 말로 가장 적절한 것은? [2.8점]

[I] In many sports, people came to see how hard, or even impossible, it is for young children to take full part in adult sporting environments. Children are unlikely to succeed if they play on adult fields, courts, or arenas with equipment that is too large, too heavy, or too fast for them to handle while trying to compete in adult-style competition. Common sense has won out: different sports have _____(A)_____. Baseball, for example, has T-ball, football has flag football, and junior soccer uses a smaller, lighter ball and sometimes a smaller field. All of them have junior competitions in which children play for shorter periods and often in smaller teams. Similarly, tennis has changed its courts, balls, and rackets to make them more suitable for children under 10, and these changes are introduced step by step according to a child's age.

[II] Studies show that athletes behave badly less often than people who do not play sports. However, moral reasoning and good sporting behavior seem to weaken as athletes move up to higher competitive levels, partly because of the growing emphasis on winning. Winning, then, can be a double-edged sword when it comes to building character. Some athletes want to win so badly that they lie, cheat, and break team rules, developing undesirable traits that may help them win in the short term. When athletes resist the temptation to win dishonestly, however, they can develop positive traits that last a lifetime. Character is a learned behavior, and a sense of fair play develops only if _____(B)_____.

① (A) required children to train the way adult athletes do — (B) players are left to learn it on their own
② (A) kept their adult rules but shortened the season — (B) coaches make a careful plan to teach it
③ (A) made changes so that children can take part more easily — (B) athletes are rewarded mainly for winning
④ (A) reshaped their fields, balls, and rules to fit young players — (B) coaches deliberately set out to teach it
⑤ (A) banned children from competitive games — (B) athletes reach the highest competitive levels

24. 윗글 [I]과 [II]의 공통된 주제로 가장 적절한 것은? [2.8점]

[I] The prevailing view among developmental scientists is that people actively contribute to their own development. We are influenced by the physical and social settings in which we live, but we also help shape our development by interacting with those settings and changing them. Even infants affect the world around them and build their own development through their interactions. Think of a baby who smiles at every adult he sees. He changes his world, because adults are likely to smile back, use "baby talk," and play with him in response. In this way, the baby draws adults close, creating one-on-one interactions and chances to learn. By engaging with the world around them, thinking, staying curious, and interacting with people and objects, individuals of all ages become "manufacturers of their own development."

[II] Personal interest can be a powerful key to engagement and achievement. Rosalie Fink's work has had a deep influence on both my research and my teaching. She interviewed twelve highly successful adults, including a physicist, a biochemist, and a company CEO. All of them had dyslexia and had struggled seriously with reading throughout their school years. Fink expected to find that they had avoided reading and found ways to get around it or make up for it with other learning strategies, but she discovered the opposite. "To my surprise, I found that these dyslexics were enthusiastic readers... they rarely avoided reading. On the contrary, they sought out books." What all of her subjects had in common was a passion for some personal interest, from religion and math to business, science, history, and biography. What mattered was that they read eagerly to find out more.

* dyslexia: 난독증

① the role of teachers in choosing texts for struggling readers
② how social surroundings decide the course of a child's development
③ ways to help students with dyslexia overcome their reading problems
④ the importance of early smiles in forming bonds with adults
⑤ how people's own actions drive their growth

25. 다음 글의, 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은? [2.8점]

Think of the brain as a city. If you looked out over a city and asked where its economy is located, you would find that there is no good answer to the question. The economy is not found in any one place; instead, it arises from _____(A)_____, from the stores and the banks to the merchants and the customers. The same is true of how the brain operates: its work does not happen in one spot. Just as in a city, no neighborhood of the brain operates in isolation. In both brains and cities, everything emerges from the way residents connect with one another, at every scale, both locally and at a distance. Just as trains carry raw materials into a city, where they are processed into goods for the economy, the raw electrochemical signals from the sense organs are carried along superhighways of neurons. There, the signals are processed and transformed into _____(B)_____. Only at that stage do we actually see, hear, or feel anything at all.

* electrochemical: 전기 화학적인

	(A)	(B)
①	a single central district	our experience of the world
②	the interaction of all its parts	stored memories
③	our experience of the world	the interaction of all its parts
④	the interaction of all its parts	our experience of the world
⑤	the decisions of a few leaders	stored memories

서술형 1. 다음 글 [A]의 내용을 표 [B]로 도식화 하였다. [B]의 빈칸 (a), (b), (c)에 들어가기에 가장 적절한 어구를 글 [A]에서 찾아서 주어진 조건에 맞게 쓰시오. 〈조건〉 - 본문에 나온 표현 그대로 쓸 것, 변형 금지 [6점]

[A]

In one study, participants were asked to answer questions such as "Why does the moon have phases?" Half of them were told to look up the answers on the internet, while the other half were not allowed to do so. In the second stage of the study, every participant was given a new set of questions, for example, "Why does Swiss cheese have holes?" Because these questions were unrelated to the ones from the first stage, the participants who had searched the internet had absolutely no advantage over those who had not. You might therefore expect both groups to judge their chances on the new questions in the same way. However, those who had gone online in the first stage rated themselves as more knowledgeable than the others, even about questions they had never searched for. The study suggests that simply having access to unrelated information was enough to inflate their intellectual confidence.

[B]

Stage	What happened
Stage 1	Half the participants looked up answers online; the other half did not.
Stage 2	Searching online for the first questions did not help with the new ones: it gave one group no (a) _____ over the other.
Result	Those who had gone online judged that they knew more; they saw themselves as more (b) _____ than the others.
Conclusion	Just being able to look things up can (c) _____ people's belief in how much they know.

(a) _____ (b) _____ (c) _____

서술형 2. 다음 글에서 어법상 잘못된 부분이 있는 두 문장을 찾아, 번호와 함께 바르게 고치시오. (답안 작성 예: 0번: natural → naturally) [4점]

Imagine that you are pedaling your bicycle on a level road. You stop pedaling, and since no force is now acting to move you forward, you gradually slow down.

[(1) If what you want is to slow down more suddenly, in a much shorter distance, the simplest thing that you can do, as every cyclist soon learns, is to put the brakes on.] [(2) Because the brakes change your movement, making you slow down more suddenly than you otherwise would, it follows that they must be exerting a force on the bicycle and you as they grip and rub on the wheel rims.] [(3) This is the force called friction, which, by acting in the direction opposite to movement, tend to slow down any moving thing that it comes into contact with, whether it is a wheel or a sliding box.] [(4) Even without the brakes on, there are other friction forces acting on you and your bicycle, one of which is the friction produced when the wheels rub on the axles, and it is these forces that also slow you down.] [(5) Another is air resistance, where you can feel pushing you backwards as you and the bicycle move forwards, and when you apply these ideas to something around you, like a cart, you can see that most of its friction comes from the axles rubbing on its body as they rotate.]

* exert: (힘을) 가하다 ** axle: (바퀴의) 축

( )번 : _____ → _____

( )번 : _____ → _____

서술형 3. 다음 글을 읽고 질문에 대한 답을 아래 조건에 따라 영어로 쓰시오. [4점]

Deep in the forest, Compean's cell phone could not pick up a signal. To make matters worse, its battery was almost dead. He climbed up to a higher spot, where he found a weak signal. Using the last of his battery, he sent a text message to his friend, saying that he was lost and needed help. He also attached a picture of the area around him. His friend passed the message and the picture on to the local police, who immediately sent out a rescue team. Although they searched through the night, the police still had no idea where Compean was. In the picture, his legs, covered in black ash from the recent forest fires, were hanging over the edge of a canyon with rocks and green trees. However, the picture was of little help to the police, since its quality was poor because of the weak signal and his location settings were turned off.

Q. Why was the picture Compean sent of so little help to the police?

답 → It was of little help partly because the picture _____ _____.

[조건]
1. 주어진 단어(구)를 모두 사용하되, 새로운 단어는 추가하지 말 것
2. 단어의 형태는 문맥에 맞게 변형할 수 있음.
3. 묶음으로 제시된 단어(구)는 분리하지 말고 사용할 것.
4. 문장을 완성하는 데 필요한 경우, 문장부호를 적절히 사용할 것.
   (예시 , / . / ! / ; / : 등등)

[단어(구)] the place / make / poor in quality / it / due to / to recognize / be / hard / the weak signal

서술형 4. 다음 글을 읽고 빈칸에 들어갈 가장 적절한 영어 단어를 쓰시오. [6점]

Have you ever been surprised when you heard a recording of your own voice? Perhaps you wondered, "Do I really sound like that?" Your accent may have seemed stronger in the recording than you thought, or your voice may have sounded higher than it does to your own ears. This is actually a very common experience, and the reason behind it is fairly simple. When we speak, we hear our own voice through two different pathways. The first is the same route by which we hear most outside sounds: waves travel through the air and pass through the outer, middle, and inner ear. But because our vocal cords vibrate as we speak, there is also a second, internal path. The vibrations travel through our bones and reach our inner ears directly, and along this path, lower frequencies are boosted. As a result, your voice sounds deeper and richer to you than it does to anyone else.

⬇

Because the vibrations reaching us through our bones s _ _ _ _ _ _ _ _ the low tones of our voice, the voice we know best is a private one that no one else can hear, and the one a recording gives back sounds u _ _ _ _ _ _ _ _ _, almost like a stranger's voice, even though it is our own.

[조건] 1. 각 단어는 제시된 알파벳으로 시작할 것
2. 빈칸의 글자 수에 맞게 답을 쓸 것 (예시: s t u d e n t)
3. 본문에 있는 단어를 그대로 옮겨 쓰지 말 것

답: s _____
u _____

서술형 5. 다음 글을 읽고 빈칸에 들어갈 말을 박스 안에 주어진 표현을 모두 사용하여 의미와 어순에 맞게 숫자를 배열하시오. (답은 숫자로만 적을 것, 모든 숫자를 사용할 것) (예시답: 1-5-4-3-…) [4점]

People are attracted to individuals and things they cannot readily obtain. When it comes to things, we find a desired object more attractive precisely because it is out of our reach. _____. Christmas presents are a good example of this. Toys that children wanted all year long are often tossed aside a few days after they are taken out of the gift boxes under the tree. The same holds true for human relationships, especially in their early stages, and the familiar dating rule of "playing hard to get" actually has some scientific basis. A person should not always make himself or herself easily available to someone he or she hopes to have a long-term relationship with. A certain degree of unavailability will make you more of a mystery and a challenge.

1. what	2. once	3. to it
4. fades quickly	5. people	6. their attraction
7. finally get	8. they wanted	

답: _____

서술형 6. 다음 글을 읽고, 〈보기〉에서 글의 내용과 일치하는 문장의 번호를 모두 찾아 쓰시오. (채점기준: 틀린 개수당 1점씩 감점, 최하점 0점) [6점]

The desert tortoise has a simple way of dealing with the extreme heat of Death Valley: it avoids it. This slow-moving animal hibernates through the winter and stays in its underground tunnel for much of the summer, which means that it spends more than 90 percent of its life without moving. In fact, the tortoise usually comes out only after a heavy rain, and then it gets busy. It stores up water by eating plants and by digging holes to collect rainwater. To keep itself supplied with water during its long hibernation, however, the reptile depends on something else: its remarkable bladder. Unlike the bladders of most animals, the tortoise's bladder works as a storage tank, allowing the animal to take water back into its body. Amazingly, a desert tortoise can survive a whole year without drinking any fresh water at all. Because the bladder is so vital to its survival, park rangers often ask visitors not to stop and carry the slow creatures across the road. When people pick them up, tortoises become so frightened that they empty their bladders and lose their precious supply of water.

* hibernate: 동면하다 ** bladder: 방광

[보기]
1. The desert tortoise deals with Death Valley's heat by avoiding it rather than by enduring it.
2. The tortoise spends the greater part of its life without moving.
3. The tortoise stays in its tunnel mainly to escape the cold of winter.
4. The tortoise gets water not only from plants but also by collecting rainwater.
5. The tortoise's bladder stores water in much the same way as those of most animals do.
6. Water held in the bladder can go back into the tortoise's body.
7. A desert tortoise can survive for several years without drinking fresh water.
8. Rangers are concerned that tortoises lose water when visitors pick them up.
9. Tortoises empty their bladders on purpose to make themselves lighter when picked up.
10. Helping a tortoise across the road can actually put its survival at risk.

답: _____

끝.
