We can sometimes assume that the [ⓐ **whole** / ⓑ **fragmented**] will be as [ⓐ **inferior** / ⓑ **good**] as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is [ⓐ **productive** / ⓑ **idle**] and [ⓐ **wasteful** / ⓑ **efficient**]. It might seem [ⓐ **absurd** / ⓑ **logical**] to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily [ⓐ **true** / ⓑ **erroneous**]. The fallacy of composition fails to allow for how the [ⓐ **different** / ⓑ **identical**] "parts" interact with each other — if, for example, your efficient administrator and your [ⓐ **inept** / ⓑ **highly skilled**] head of IT each assumes the other is in charge of [ⓐ **collating** / ⓑ **dispersing**] prototype test results, then you have a problem. Equally, a unit composed of good people can still be working on a [ⓐ **promising** / ⓑ **doomed**] project, and a project composed of good ideas may lack a [ⓐ **volatile** / ⓑ **stable**] center. When [ⓐ **dismantling** / ⓑ **assembling**] a team with a [ⓐ **common** / ⓑ **incompatible**] goal, always check the [ⓐ **piecemeal** / ⓑ **overall**] view as well as the individuals involved.

21

Humans [ⓐ **falter** / ⓑ **excel**] at visual imagery. Our brains [ⓐ **evolved** / ⓑ **regressed**] this ability to create an [ⓐ **internal** / ⓑ **external**] mental picture or model of the world in which we can rehearse [ⓐ **forthcoming** / ⓑ **bygone**] actions, without the [ⓐ **safeguards** / ⓑ **risks**] or the penalties of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to [ⓐ **imagine** / ⓑ **perceive**] a scene as when you [ⓐ **ostensibly** / ⓑ **actually**] view one. But evolution has seen to it that such internally generated representations are never as [ⓐ **authentic** / ⓑ **spurious**] as the real thing. This is a [ⓐ **wise** / ⓑ **imprudent**] bit of [ⓐ **self-restraint** / ⓑ **indulgence**] on your genes' part. If your internal model of the world were a [ⓐ **defective** / ⓑ **perfect**] substitute, then anytime you felt [ⓐ **satiated** / ⓑ **hungry**] you could simply imagine yourself at a banquet, consuming a feast. You would have no [ⓐ **incentive** / ⓑ **deterrent**] to find real food and would soon starve to death. As the Bard said, "You cannot cloy the hungry edge of appetite by bare imagination of a feast."

22

For each [ⓐ **objective** / ⓑ **subjective**] probability — from one percent to 100 percent — we want to [ⓐ **disregard** / ⓑ **know**] the subjective probability weight. When we make decisions, do we [ⓐ **disregard** / ⓑ **treat**] a one-percent chance just like one percent, or like something else? Events that could happen but aren't [ⓐ **inevitable** / ⓑ **likely**] — low-probability events — can be [ⓐ **obscured** / ⓑ **defined**] as probabilities up to about 25 percent. Low-probability events [ⓐ **cease** / ⓑ **tend**] to factor more into decisions than they should. That is, an event that has an objective one-percent chance of [ⓐ **occurring** / ⓑ **ceasing**] could [ⓐ **objectively** / ⓑ **subjectively**] seem like it has a five-percent chance of occurring. We [ⓐ **understate** / ⓑ **overestimate**] the [ⓐ **impossibility** / ⓑ **likelihood**] of these low-probability events. In general, the [ⓐ **greater** / ⓑ **smaller**] the probability, the more we overestimate its likelihood. For example, people who play the lottery are often [ⓐ **despondent** / ⓑ **optimistic**] about winning. However, the odds of a single ticket winning the [ⓐ **largest** / ⓑ **minutest**], most [ⓐ **obscure** / ⓑ **popular**] U.S. lotteries are on the order of one in 175 million.

23

Many of the [ⓐ **barriers** / ⓑ **incentives**] to trade exist not because of a [ⓐ **lack** / ⓑ **abundance**] of markets or customers, but because there are major barriers to getting products to market at [ⓐ **inferior** / ⓑ **competitive**] prices. Transaction costs are [ⓐ **significant** / ⓑ **negligible**] for companies — not only the [ⓐ **straight** / ⓑ **indirect**] exchange costs, but also the cost of [ⓐ **preserving** / ⓑ **converting**], paying, and [ⓐ **exposing** / ⓑ **hedging**] funds just to pay for the goods and services. Having a [ⓐ **exclusive** / ⓑ **common**] currency means that many of those transaction costs [ⓐ **persist** / ⓑ **disappear**] and the savings can be reinvested back into firms' productivity and [ⓐ **stagnation** / ⓑ **innovation**]. Basically, useless costs turn into productive costs — with [ⓐ **longer-term** / ⓑ **fleeting**] benefits to the whole economy. By unifying some of the currencies, whole economies benefit and [ⓐ **grow** / ⓑ **deteriorate**] more than they would as independents. So a common currency provides for a strong economic foundation that all can benefit from.

The [ⓐ darkness / ⓑ light] from even our [ⓐ nearest / ⓑ most remote] stellar neighbour takes four years to [ⓐ elude / ⓑ reach] us. When we [ⓐ look / ⓑ ignore] at the stars, we are looking back in time. This is an [ⓐ ordinary / ⓑ incredible] [ⓐ burden / ⓑ gift]. We can see parts of [ⓐ confinement / ⓑ space], parts of our universe, as they were many years ago. The further we can [ⓐ collect / ⓑ scatter] light from, the further back in time we can look. If you look at the [ⓐ bright / ⓑ dim] star Betelgeuse, which [ⓐ glows / ⓑ fades] in the Orion constellation, you wind time back more than six hundred years. Its reddish glow started its [ⓐ standstill / ⓑ journey] to Earth in the Middle Ages. The stars in Orion's belt are even [ⓐ further / ⓑ closer] away. Their light, [ⓐ familiar / ⓑ alien] to generations of humans, has travelled at least 1,000 years to reach us. This means we have a chance of [ⓐ understanding / ⓑ misunderstanding] the history of the universe because we can see the more distant parts of it as they were in the past, thousands or millions or billions of years ago.

29

The [ⓐ renowned / ⓑ obscure] British philosopher Alfred North Whitehead [ⓐ denied / ⓑ asserted] that "civilization [ⓐ advances / ⓑ regresses] by [ⓐ curtailing / ⓑ extending] the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a [ⓐ reduced / ⓑ inflated] purchase price by presenting the coupon. The [ⓐ extent / ⓑ paucity] to which we have learned to operate mechanically on that assumption is [ⓐ obscured / ⓑ illustrated] in the experience of one automobile-tire company. [ⓐ withheld / ⓑ Mailed-out] coupons that — because of a printing error — offered no savings to recipients produced just as much customer [ⓐ indifference / ⓑ response] as did [ⓐ defective / ⓑ error-free] coupons that offered [ⓐ negligible / ⓑ substantial] savings. The obvious but instructive point here is that we expect discount coupons to do [ⓐ double / ⓑ singular] duty. Not only do we expect them to save us money, we also expect them to save us the time and mental energy [ⓐ required / ⓑ optional] to think about how to do it. In today's world, we need the first advantage to handle pocketbook [ⓐ strain / ⓑ ease]; but we need the second advantage to handle something potentially more [ⓐ trivial / ⓑ important] — brain strain.

30

Usually, [ⓐ **obsolete** / ⓑ **innovative**] [ⓐ **high-tech** / ⓑ **primitive**] products have [ⓐ **elevated** / ⓑ **low**] price elasticity. This means that high [ⓐ **uniformity** / ⓑ **variation**] in price, an increase as well as a decrease, does not significantly [ⓐ **preserve** / ⓑ **modify**] demand. These high-tech products have few [ⓐ **equivalents** / ⓑ **substitutes**], meaning that the costs to switch to another product are [ⓐ **negligible** / ⓑ **high**]. Additionally, at the [ⓐ **first** / ⓑ **final**] stage of the technology, buyers — either innovators or forerunners — are less [ⓐ **indifferent** / ⓑ **sensitive**] to price than to additional performance; they often have deep pockets or are ready to [ⓐ **spend** / ⓑ **conserve**] a lot for a new innovative and [ⓐ **outstanding** / ⓑ **mediocre**] product. For instance, with its new product range, a [ⓐ **inferior** / ⓑ **high-end**] mobile phone manufacturer is aiming at the 3% of millionaire households with assets of more than $2.5 million; those are customers who are ready to [ⓐ **reject** / ⓑ **accept**] the price range the manufacturer has set. At that stage, the competitors are not [ⓐ **averse** / ⓑ **interested**] in lowering their price significantly whatsoever, because they are [ⓐ **shunning** / ⓑ **chasing**] the same categories of customers, not sensitive to price. Furthermore, the high price of these products is often [ⓐ **ignored** / ⓑ **perceived**] as a sign of quality and [ⓐ **undermines** / ⓑ **reinforces**] a customer's confidence in the company.

31

One easily underappreciated feature of a city street or square is its "[ⓐ **future-proof** / ⓑ **obsolete**]" nature. The [ⓐ **ancient** / ⓑ **modern**] medieval squares in places like Marrakesh and Siena are still places where stuff is sold every day, even if the stuff itself has [ⓐ **changed** / ⓑ **remained**] over the last five hundred years. The city square is a fairly future-proof technology, as is the shopping street, even in an age of [ⓐ **offline** / ⓑ **online**] shopping. For example, the same [ⓐ **virtual** / ⓑ **physical**] store that once sold buggy whips and typewriters might now repair [ⓐ **pristine** / ⓑ **damaged**] phones and sell bubble tea. The same infrastructure [ⓐ **supports** / ⓑ **obstructs**] [ⓐ **evolving** / ⓑ **static**] uses. Jane Jacobs, the [ⓐ **great** / ⓑ **minor**] prophet of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies. As she pointed out, the great [ⓐ **drawback** / ⓑ **advantage**] of a city architecture is its ability to [ⓐ **support** / ⓑ **impede**] [ⓐ **change** / ⓑ **stability**] in uses, and Jacobs [ⓐ **erroneously** / ⓑ **correctly**] predicted the [ⓐ **persistence** / ⓑ **disappearance**] of the city itself, unlike those who predicted the [ⓐ **rise** / ⓑ **fall**] of the Internet would mean the death of the city.

The genomics revolution made it possible to see just how [ⓐ **impactful** / ⓑ **negligible**] touch is to plants on a [ⓐ **deeper** / ⓑ **superficial**] level. Peering at the genes of Arabidopsis thaliana, a [ⓐ **weedy** / ⓑ **cultivated**] plant in the mustard family and the lab rat of the plant biology world, researchers saw that touch [ⓐ **quietly** / ⓑ **conspicuously**] triggered such a [ⓐ **trivial** / ⓑ **dramatic**] response in their hormones and gene expression that it could substantially [ⓐ **expedite** / ⓑ **inhibit**] their growth. They stroked the arabidopsis with [ⓐ **soft** / ⓑ **abrasive**] paintbrushes, and then analyzed the plants' genetic responses. Within thirty minutes of being touched, 10 percent of the plant's genome was [ⓐ **altered** / ⓑ **stabilized**]. Clearly, the plant was reorganizing its priorities to deal with the [ⓐ **disturbance** / ⓑ **serenity**], and rerouting energy away from the [ⓐ **effortless** / ⓑ **hard**] work of getting [ⓐ **shorter** / ⓑ **taller**]. Touched multiple times, arabidopsis cut its [ⓐ **upward** / ⓑ **downward**] growth rate by as much as 30 percent.

37

Think about a time when you were [ⓐ **composed** / ⓑ **startled**]. Did you come to a [ⓐ **gradual** / ⓑ **sudden**] [ⓐ **proceed** / ⓑ **stop**], freeze all your movements, and hold your breath as you [ⓐ **scanned** / ⓑ **disregarded**] the environment for a threat? All these responses [ⓐ **maximize** / ⓑ **curtail**] our ability to avoid detection, locate the source of possible danger, and prepare to fight or flee. As [ⓐ **rudimentary** / ⓑ **sophisticated**] as language has become, it is still the creation of sound that might give away our location to a potential [ⓐ **guardian** / ⓑ **predator**]. Because of this, the freeze response results in the [ⓐ **expression** / ⓑ **inhibition**] of language in highly [ⓐ **stressful** / ⓑ **tranquil**] and traumatic situations. Natural selection promoted the evolution of language but conserved the freeze rule. When the threat [ⓐ **passes** / ⓑ **persists**], we begin to [ⓐ **stiffen** / ⓑ **relax**] and find our voices again, perhaps even to laugh at our own reactions. But what if we can never relax? What if our experiences shape our brain to be in a [ⓐ **sporadic** / ⓑ **constant**] state of fear? This interference with the [ⓐ **faulty** / ⓑ **proper**] development and integration of neural networks can result in [ⓐ **transient** / ⓑ **chronic**] stress and even mental illness.

38

Video gaming is one of the most [ⓐ **ignored** / ⓑ **studied**] technologies with regard to [ⓐ **apathy** / ⓑ **empathy**]. Because there have been longstanding [ⓐ **assurances** / ⓑ **concerns**] about the [ⓐ **insignificance** / ⓑ **impact**] of violent video games on youth, much [ⓐ **conjecture** / ⓑ **research**] has been conducted over the last couple of decades on the topic. While measuring and documenting the impact of video game violence, scientists have formulated [ⓐ **credible** / ⓑ **dubious**] explanations of how video gaming could affect empathy. Part of a [ⓐ **aberrant** / ⓑ **normal**], healthy reaction to witnessing violent events is to feel [ⓐ **favorable** / ⓑ **negative**] emotions, and to experience physiological [ⓐ **lethargy** / ⓑ **arousal**] that is connected to fear or disgust. With [ⓐ **sporadic** / ⓑ **repeated**] exposure to violent events — such as what might happen when a person plays violent video games — this normal reaction might become [ⓐ **intensified** / ⓑ **blunted**], a phenomenon known as desensitization. The next step in this [ⓐ **problematic** / ⓑ **beneficial**] process would be having [ⓐ **heightened** / ⓑ **diminished**] emotional responses to violence, which could also interfere with the ability to recognize and/or to sympathize with others, leading to [ⓐ **augmented** / ⓑ **reduced**] empathy. A significant body of work shows an association between [ⓐ **extensive** / ⓑ **negligible**] violent video gaming and reduced empathy in people.

39

Realising the benefits of [ⓐ **uniformity** / ⓑ **differentiation**], some brands [ⓐ **broadcast** / ⓑ **conceal**] their social purpose before they do much [ⓐ **nominal** / ⓑ **actual**] good. Their marketers are using social purpose to [ⓐ **boost** / ⓑ **diminish**] the brand's reputation, rather than embracing the purpose itself. Making a [ⓐ **illusory** / ⓑ **real**] difference with social problems is [ⓐ **hard** / ⓑ **facile**] enough; to succeed, it has to follow from an [ⓐ **authentic** / ⓑ **spurious**], [ⓐ **isolated** / ⓑ **company-wide**] commitment to the purpose. Otherwise the mission is just [ⓐ **sincerity** / ⓑ **window-dressing**], or what we call "purpose-washing" — [ⓐ **similar** / ⓑ **disparate**] to green-washing, where purpose-driven activities serve mainly for publicity purposes. We end up with what Anand Giridhardas describes in Winners Take All: "social purpose that just [ⓐ **impedes** / ⓑ **furthers**] the charade of elites disrupting the old order without giving much back". Purpose-washing brands [ⓐ **forfeit** / ⓑ **gain**] one of the benefits of social purpose, differentiation, but only for a [ⓐ **short** / ⓑ **protracted**] while. They lose out on positioning for [ⓐ **bygone** / ⓑ **future**] markets, and they might even make employees feel [ⓐ **better** / ⓑ **worse**] about working for them.

We can sometimes [ⓐ **presume** / ⓑ **doubt**] that the whole will be as [ⓐ **strong** / ⓑ **poor**] as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is [ⓐ **effective** / ⓑ **lazy**] and [ⓐ **capable** / ⓑ **wasteful**]. It might seem [ⓐ **absurd** / ⓑ **reasonable**] to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily true. The fallacy of composition fails to allow for how the different "parts" [ⓐ **separate** / ⓑ **engage**] with each other — if, for example, your efficient administrator and your highly [ⓐ **competent** / ⓑ **unqualified**] head of IT each assumes the other is in charge of collating prototype test results, then you have a problem. Equally, a unit composed of [ⓐ **incompetent** / ⓑ **capable**] people can still be working on a [ⓐ **promising** / ⓑ **failing**] project, and a project composed of good ideas may [ⓐ **miss** / ⓑ **possess**] a [ⓐ **shaky** / ⓑ **solid**] center. When [ⓐ **disbanding** / ⓑ **building**] a team with a [ⓐ **shared** / ⓑ **conflicting**] goal, always check the overall view as well as the individuals involved.

21

Humans [ⓐ **struggle** / ⓑ **thrive**] at visual imagery. Our brains evolved this ability to create an internal mental picture or model of the world in which we can [ⓐ **abandon** / ⓑ **practice**] forthcoming actions, without the risks or the [ⓐ **rewards** / ⓑ **consequences**] of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to imagine a scene as when you actually view one. But evolution has seen to it that such internally generated representations are never as [ⓐ **genuine** / ⓑ **fabricated**] as the real thing. This is a [ⓐ **foolish** / ⓑ **prudent**] bit of self-restraint on your genes' part. If your internal model of the world were a [ⓐ **inferior** / ⓑ **flawless**] substitute, then anytime you felt [ⓐ **famished** / ⓑ **full**] you could simply imagine yourself at a banquet, [ⓐ **refusing** / ⓑ **devouring**] a [ⓐ **banquet** / ⓑ **morsel**]. You would have no [ⓐ **deterrent** / ⓑ **motivation**] to find [ⓐ **actual** / ⓑ **imaginary**] food and would soon [ⓐ **thrive** / ⓑ **perish**] to death. As the Bard said, "You cannot cloy the hungry edge of appetite by [ⓐ **mere** / ⓑ **abundant**] imagination of a feast."

22

For each objective probability — from one percent to 100 percent — we want to know the subjective probability weight. When we make decisions, do we treat a one-percent chance just like one percent, or like something else? Events that could happen but aren't likely — low-probability events — can be defined as probabilities up to about 25 percent. Low-probability events tend to factor more into decisions than they should. That is, an event that has an objective one-percent chance of occurring could subjectively seem like it has a five-percent chance of occurring. We [ⓐ **underestimate** / ⓑ **overstate**] the [ⓐ **probability** / ⓑ **impossibility**] of these low-probability events. In general, the [ⓐ **lower** / ⓑ **greater**] the probability, the more we overestimate its likelihood. For example, people who play the lottery are often [ⓐ **hopeful** / ⓑ **pessimistic**] about [ⓐ **losing** / ⓑ **succeeding**]. However, the [ⓐ **certainty** / ⓑ **chances**] of a [ⓐ **sole** / ⓑ **multiple**] ticket winning the [ⓐ **smallest** / ⓑ **biggest**], most [ⓐ **obscure** / ⓑ **well-known**] U.S. lotteries are on the [ⓐ **exception** / ⓑ **scale**] of one in 175 million.

23

Many of the [ⓐ **obstacles** / ⓑ **pathways**] to trade exist not because of a lack of markets or customers, but because there are major barriers to getting products to market at [ⓐ **exorbitant** / ⓑ **affordable**] prices. Transaction costs are [ⓐ **considerable** / ⓑ **negligible**] for companies — not only the straight exchange costs, but also the cost of converting, paying, and hedging funds just to pay for the goods and services. Having a common currency means that many of those transaction costs [ⓐ **vanish** / ⓑ **accumulate**] and the [ⓐ **losses** / ⓑ **gains**] can be [ⓐ **withdrawn** / ⓑ **channeled**] back into firms' [ⓐ **efficiency** / ⓑ **stagnation**] and innovation. Basically, [ⓐ **wasteful** / ⓑ **essential**] costs turn into [ⓐ **futile** / ⓑ **fruitful**] costs — with longer-term benefits to the whole economy. By [ⓐ **fragmenting** / ⓑ **consolidating**] some of the currencies, whole economies benefit and [ⓐ **shrink** / ⓑ **expand**] more than they would as [ⓐ **partners** / ⓑ **separate entities**]. So a common currency provides for a [ⓐ **solid** / ⓑ **fragile**] economic foundation that all can benefit from.

The light from even our nearest stellar neighbour takes four years to reach us. When we look at the stars, we are looking back in time. This is an [ⓐ **unremarkable** / ⓑ **extraordinary**] gift. We can see parts of space, parts of our universe, as they were many years ago. The [ⓐ **closer** / ⓑ **farther**] we can collect light from, the further back in time we can look. If you look at the [ⓐ **dim** / ⓑ **luminous**] star Betelgeuse, which [ⓐ **fades** / ⓑ **shines**] in the Orion constellation, you wind time back more than six hundred years. Its [ⓐ **crimson** / ⓑ **pale**] glow [ⓐ **concluded** / ⓑ **began**] its [ⓐ **voyage** / ⓑ **stay**] to Earth in the Middle Ages. The stars in Orion's belt are even further away. Their light, [ⓐ **known** / ⓑ **foreign**] to [ⓐ **moments** / ⓑ **ages**] of humans, has [ⓐ **remained** / ⓑ **journeyed**] at least 1,000 years to reach us. This means we have a [ⓐ **barrier** / ⓑ **opportunity**] of [ⓐ **ignoring** / ⓑ **grasping**] the history of the universe because we can see the more [ⓐ **nearby** / ⓑ **remote**] parts of it as they were in the past, thousands or millions or billions of years ago.

The [ⓐ **obscure** / ⓑ **celebrated**] British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to [ⓐ **doubt** / ⓑ **presume**] that they will receive a [ⓐ **lowered** / ⓑ **inflated**] purchase price by presenting the coupon. The [ⓐ **degree** / ⓑ **exception**] to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no [ⓐ **costs** / ⓑ **discounts**] to recipients produced just as much customer response as did error-free coupons that offered [ⓐ **negligible** / ⓑ **considerable**] savings. The [ⓐ **evident** / ⓑ **subtle**] but [ⓐ **misleading** / ⓑ **enlightening**] point here is that we expect discount coupons to do double duty. Not only do we expect them to [ⓐ **spare** / ⓑ **cost**] us money, we also expect them to save us the time and mental [ⓐ **lethargy** / ⓑ **effort**] required to think about how to do it. In today's world, we need the first [ⓐ **benefit** / ⓑ **drawback**] to handle pocketbook [ⓐ **relief** / ⓑ **pressure**]; but we need the second advantage to handle something potentially more [ⓐ **significant** / ⓑ **trivial**] — brain strain.

Usually, [ⓐ **outdated** / ⓑ **groundbreaking**] high-tech products have low price elasticity. This means that high [ⓐ **stability** / ⓑ **fluctuation**] in price, an increase as well as a decrease, does not significantly [ⓐ **preserve** / ⓑ **alter**] demand. These high-tech products have few substitutes, meaning that the costs to [ⓐ **transition** / ⓑ **remain**] to another product are high. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less [ⓐ **responsive** / ⓑ **indifferent**] to price than to additional performance; they often have deep pockets or are [ⓐ **willing** / ⓑ **reluctant**] to spend a lot for a new innovative and [ⓐ **exceptional** / ⓑ **mediocre**] product. For instance, with its new product range, a high-end mobile phone manufacturer is aiming at the 3% of millionaire households with [ⓐ **holdings** / ⓑ **debts**] of more than $2.5 million; those are customers who are ready to [ⓐ **embrace** / ⓑ **reject**] the price range the manufacturer has set. At that stage, the [ⓐ **allies** / ⓑ **rivals**] are not interested in lowering their price significantly whatsoever, because they are chasing the same categories of customers, not sensitive to price. Furthermore, the [ⓐ **modest** / ⓑ **elevated**] price of these products is often perceived as a [ⓐ **indicator** / ⓑ **denial**] of quality and reinforces a customer's [ⓐ **doubt** / ⓑ **trust**] in the company.

One easily underappreciated feature of a city street or square is its "future-proof" nature. The [ⓐ **age-old** / ⓑ **modern**] medieval squares in places like Marrakesh and Siena are still places where stuff is [ⓐ **traded** / ⓑ **hoarded**] every day, even if the stuff itself has [ⓐ **stagnated** / ⓑ **shifted**] over the last five hundred years. The city square is a fairly future-proof technology, as is the shopping street, even in an age of online shopping. For example, the same [ⓐ **virtual** / ⓑ **tangible**] store that once sold buggy whips and typewriters might now [ⓐ **damage** / ⓑ **fix**] damaged phones and sell bubble tea. The same infrastructure supports [ⓐ **static** / ⓑ **changing**] uses. Jane Jacobs, the great [ⓐ **visionary** / ⓑ **skeptic**] of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies. As she pointed out, the great [ⓐ **strength** / ⓑ **weakness**] of a city architecture is its [ⓐ **capacity** / ⓑ **inability**] to support [ⓐ **shifts** / ⓑ **uniformity**] in uses, and Jacobs [ⓐ **accurately** / ⓑ **wrongly**] predicted the [ⓐ **decline** / ⓑ **endurance**] of the city itself, unlike those who predicted the [ⓐ **emergence** / ⓑ **collapse**] of the Internet would mean the [ⓐ **flourishing** / ⓑ **demise**] of the city.

The genomics revolution made it possible to see just how [ⓐ **trivial** / ⓑ **significant**] touch is to plants on a deeper level. Peering at the genes of Arabidopsis thaliana, a [ⓐ **cultivated** / ⓑ **wild**] plant in the mustard family and the lab rat of the plant biology world, researchers saw that touch [ⓐ **overtly** / ⓑ **subtly**] triggered such a [ⓐ **profound** / ⓑ **mild**] response in their hormones and gene expression that it could [ⓐ **negligibly** / ⓑ **considerably**] inhibit their growth. They [ⓐ **avoided** / ⓑ **brushed**] the arabidopsis with [ⓐ **coarse** / ⓑ **gentle**] paintbrushes, and then analyzed the plants' genetic responses. Within thirty minutes of being touched, 10 percent of the plant's genome was [ⓐ **modified** / ⓑ **preserved**]. Clearly, the plant was [ⓐ **maintaining** / ⓑ **reshuffling**] its priorities to deal with the [ⓐ **disruption** / ⓑ **calm**], and rerouting energy away from the [ⓐ **demanding** / ⓑ **effortless**] work of getting taller. Touched multiple times, arabidopsis cut its upward growth rate by as much as 30 percent.

Think about a time when you were [ⓐ **calm** / ⓑ **surprised**]. Did you come to a sudden stop, [ⓐ **halt** / ⓑ **continue**] all your movements, and hold your breath as you [ⓐ **surveyed** / ⓑ **ignored**] the environment for a threat? All these responses [ⓐ **optimize** / ⓑ **diminish**] our ability to avoid detection, locate the source of possible [ⓐ **safety** / ⓑ **peril**], and prepare to fight or flee. As sophisticated as language has become, it is still the creation of sound that might give away our location to a potential predator. Because of this, the freeze response results in the [ⓐ **suppression** / ⓑ **encouragement**] of language in highly [ⓐ **soothing** / ⓑ **distressing**] and traumatic situations. Natural selection promoted the [ⓐ **development** / ⓑ **extinction**] of language but [ⓐ **preserved** / ⓑ **abandoned**] the freeze rule. When the threat [ⓐ **subsides** / ⓑ **emerges**], we begin to [ⓐ **tense** / ⓑ **unwind**] and find our voices again, perhaps even to laugh at our own reactions. But what if we can never relax? What if our experiences [ⓐ **mold** / ⓑ **leave**] our brain to be in a [ⓐ **perpetual** / ⓑ **fleeting**] state of fear? This interference with the proper development and integration of neural networks can result in [ⓐ **occasional** / ⓑ **persistent**] stress and even mental illness.

Video gaming is one of the most [ⓐ **examined** / ⓑ **overlooked**] technologies with regard to empathy. Because there have been longstanding concerns about the [ⓐ **irrelevance** / ⓑ **effect**] of violent video games on youth, much research has been conducted over the last couple of decades on the topic. We can sometimes assume that the whole will be as good as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is productive and efficient. It might seem logical to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily true. The fallacy of composition fails to allow for how the different "parts" interact with each other — if, for example, your efficient administrator and your highly skilled head of IT each assumes the other is in charge of collating prototype test results, then you have a problem. Equally, a unit composed of good people can still be working on a doomed project, and a project composed of good ideas may lack a stable center. When assembling a team with a common goal, always check the overall view as well as the individuals involved.

Humans excel at visual imagery. Our brains evolved this ability to create an internal mental picture or model of the world in which we can rehearse forthcoming actions, without the risks or the penalties of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to imagine a scene as when you actually view one. But evolution has seen to it that such internally generated representations are never as authentic as the real thing. This is a wise bit of self-restraint on your genes' part. If your internal model of the world were a perfect substitute, then anytime you felt hungry you could simply imagine yourself at a banquet, consuming a feast. For each objective probability — from one percent to 100 percent — we want to know the subjective probability weight. When we make decisions, do we treat a one-percent chance just like one percent, or like something else? Events that could happen but aren't likely — low-probability events — can be defined as probabilities up to about 25 percent. Low-probability events tend to factor more into decisions than they should. That is, an event that has an objective one-percent chance of occurring could subjectively seem like it has a five-percent chance of occurring. We overestimate the likelihood of these low-probability events. In general, the smaller the probability, the more we overestimate its likelihood. For example, people who play the lottery are often optimistic about winning. However, the odds of a single ticket winning the largest, most popular U.S. lotteries are on the order of one in 175 million.

11 People often give too much weight to unlikely events in decisions. O | X

The renowned British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a reduced purchase price by presenting the coupon. The extent to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no savings to recipients produced just as much customer response as did error-free coupons that offered substantial savings. The obvious but instructive point here is that we expect discount coupons to do double duty. Not only do we expect them to save us money, we also expect them to save us the time and mental energy required to think about how to do it. In today's world, we need the first advantage to handle pocketbook strain; but we need the second advantage to handle something potentially more important — brain strain.

Usually, innovative high-tech products have low price elasticity. This means that high variation in price, an increase as well as a decrease, does not significantly modify demand. These high-tech products have few substitutes, meaning that the costs to switch to another product are high. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less sensitive to price than to additional performance; they often have deep pockets or are ready to spend a lot for a new innovative and outstanding product. For instance, with its new product range, a high-end mobile phone manufacturer is aiming at the 3% of millionaire households with assets of more than $2.5 million; those are customers who are ready to accept the price range the manufacturer has set. At that stage, the competitors are not interested in lowering their price significantly whatsoever, because they are chasing the same categories of customers, not sensitive to price. Furthermore, the high price of these products is often perceived as a sign of quality and reinforces a customer's confidence in the company.

One easily underappreciated feature of a city street or square is its "future-proof" nature. The ancient medieval squares in places like Marrakesh and Siena are still places where stuff is sold every day, even if the stuff itself has changed over the last five hundred years. The city square is a fairly future-proof technology, as is the shopping street, even in an age of online shopping. For example, the same physical store that once sold buggy whips and typewriters might now repair damaged phones and sell bubble tea. The same infrastructure supports evolving uses. Jane Jacobs, the great prophet of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies. As she pointed out, the great advantage of a city architecture is its ability to support change in uses, and Jacobs correctly predicted the persistence of the city itself, unlike those who predicted the rise of the Internet would mean the death of the city.

The genomics revolution made it possible to see just how impactful touch is to plants on a deeper level. Peering at the genes of Arabidopsis thaliana, a weedy plant in the mustard family and the lab rat of the plant biology world, researchers saw that touch quietly triggered such a dramatic response in their hormones and gene expression that it could substantially inhibit their growth. They stroked the arabidopsis with soft paintbrushes, and then analyzed the plants' genetic responses. Within thirty minutes of being touched, 10 percent of the plant's genome was altered. Clearly, the plant was reorganizing its priorities to deal with the disturbance, and rerouting energy away from the hard work of getting taller. Touched multiple times, arabidopsis cut its upward growth rate by as much as 30 percent.

Think about a time when you were startled. Did you come to a sudden stop, freeze all your movements, and hold your breath as you scanned the environment for a threat? All these responses maximize our ability to avoid detection, locate the source of possible danger, and prepare to fight or flee. As sophisticated as language has become, it is still the creation of sound that might give away our location to a potential predator. Because of this, the freeze response results in the inhibition of language in highly stressful and traumatic situations. Natural selection promoted the evolution of language but conserved the freeze rule. When the threat passes, we begin to relax and find our voices again, perhaps even to laugh at our own reactions. But what if we can never relax? What if our experiences shape our brain to be in a constant state of fear? This interference with the proper development and integration of neural networks can result in chronic stress and even mental illness.

Video gaming is one of the most studied technologies with regard to empathy. Because there have been longstanding concerns about the impact of violent video games on youth, much research has been conducted over the last couple of decades on the topic. While measuring and documenting the impact of video game violence, scientists have formulated credible explanations of how video gaming could affect empathy. Part of a normal, healthy reaction to witnessing violent events is to feel negative emotions, and to experience physiological arousal that is connected to fear or disgust. With repeated exposure to violent events — such as what might happen when a person plays violent video games — this normal reaction might become blunted, a phenomenon known as desensitization. The renowned British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a reduced purchase price by presenting the coupon. The extent to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no savings to recipients produced just as much customer response as did error-free coupons that offered substantial savings. The obvious but instructive point here is that we expect discount coupons to do double duty. Not only do we expect them to save us money, we also expect them to save us the time and mental energy required to think about how to do it. These high-tech products have few substitutes, meaning that the costs to switch to another product are high. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less sensitive to price than to additional performance; they often have deep pockets or are ready to spend a lot for a new innovative and outstanding product. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less sensitive to price than to additional performance; they often have deep pockets or are ready to spend a lot for a new innovative and outstanding product. For instance, with its new product range, a high-end mobile phone manufacturer is aiming at the 3% of millionaire households with assets of more than $2.5 million; those are customers who are ready to accept the price range the manufacturer has set. At that stage, the competitors are not interested in lowering their price significantly whatsoever, because they are chasing the same categories of customers, not sensitive to price. Furthermore, the high price of these products is often perceived as a sign of quality and reinforces a customer's confidence in the company.

One easily underappreciated feature of a city street or square is its "future-proof" nature. The ancient medieval squares in places like Marrakesh and Siena are still places where stuff is sold every day, even if the stuff itself has changed over the last five hundred years. The city square is a fairly future-proof technology, as is the shopping street, even in an age of online shopping. For example, the same physical store that once sold buggy whips and typewriters might now repair damaged phones and sell bubble tea. The same infrastructure supports evolving uses. Jane Jacobs, the great prophet of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies. As she pointed out, the great advantage of a city architecture is its ability to support change in uses, and Jacobs correctly predicted the persistence of the city itself, unlike those who predicted the rise of the Internet would mean the death of the city.

The genomics revolution made it possible to see just how impactful touch is to plants on a deeper level. Peering at the genes of Arabidopsis thaliana, a weedy plant in the mustard family and the lab rat of the plant biology world, researchers saw that touch quietly triggered such a dramatic response in their hormones and gene expression that it could substantially inhibit their growth. They stroked the arabidopsis with soft paintbrushes, and then analyzed the plants' genetic responses. Within thirty minutes of being touched, 10 percent of the plant's genome was altered. Clearly, the plant was reorganizing its priorities to deal with the disturbance, and rerouting energy away from the hard work of getting taller. Touched multiple times, arabidopsis cut its upward growth rate by as much as 30 percent.

Think about a time when you were startled. Did you come to a sudden stop, freeze all your movements, and hold your breath as you scanned the environment for a threat? All these responses maximize our ability to avoid detection, locate the source of possible danger, and prepare to fight or flee. As sophisticated as language has become, it is still the creation of sound that might give away our location to a potential predator. Because of this, the freeze response results in the inhibition of language in highly stressful and traumatic situations. Natural selection promoted the evolution of language but conserved the freeze rule. When the threat passes, we begin to relax and find our voices again, perhaps even to laugh at our own reactions. But what if we can never relax? What if our experiences shape our brain to be in a constant state of fear? This interference with the proper development and integration of neural networks can result in chronic stress and even mental illness.

Video gaming is one of the most studied technologies with regard to empathy. Because there have been longstanding concerns about the impact of violent video games on youth, much research has been conducted over the last couple of decades on the topic. While measuring and documenting the impact of video game violence, scientists have formulated credible explanations of how video gaming could affect empathy. Part of a normal, healthy reaction to witnessing violent events is to feel negative emotions, and to experience physiological arousal that is connected to fear or disgust. With repeated exposure to violent events — such as what might happen when a person plays violent video games — this normal reaction might become blunted, a phenomenon known as desensitization. The next step in this problematic process would be having diminished emotional responses to violence, which could also interfere with the ability to recognize and/or to sympathize with others, leading to reduced empathy. A significant body of work shows an association between extensive violent video gaming and reduced empathy in people.

Realising the benefits of differentiation, some brands broadcast their social purpose before they do much actual good. Their marketers are using social purpose to boost the brand's reputation, rather than embracing the purpose itself. Making a real difference with social problems is hard enough; to succeed, it has to follow from an authentic, company-wide commitment to the purpose. Otherwise the mission is just window-dressing, or what we call "purpose-washing" — similar to green-washing, where purpose-driven activities serve mainly for publicity purposes. We end up with what Anand Giridhardas describes in Winners Take All: "social purpose that just furthers the charade of elites disrupting the old order without giving much back". We can sometimes assume that the whole will be as good as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is productive and efficient. It might seem logical to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily true. The fallacy of composition fails to allow for how the different "parts" interact with each other — if, for example, your efficient administrator and your highly skilled head of IT each assumes the other is in charge of collating prototype test results, then you have a problem. Equally, a unit composed of good people can still be working on a doomed project, and a project composed of good ideas may lack a stable center. When assembling a team with a common goal, always check the overall view as well as the individuals involved.

01 | What mistaken assumption is introduced at the beginning of the passage?

① That a whole will always be worse than its parts
② That the whole will be as good as each of its parts
③ That productive workers should be replaced regularly
④ That startups succeed only through strong leadership

02 | According to the passage, why might a startup with productive and efficient individuals still face problems?

① The workers may refuse to follow company rules
② The company may lack any technically skilled employees
③ The different parts may interact poorly or leave tasks undone
④ The startup may grow too quickly to remain innovative

03 | What is the main advice given in the final sentence of the passage?

① Focus only on choosing the most talented individuals
② Avoid teamwork when pursuing a common goal
③ Judge a project only by the quality of its ideas
④ Consider the overall structure as well as the individuals involved

Humans excel at visual imagery. Our brains evolved this ability to create an internal mental picture or model of the world in which we can rehearse forthcoming actions, without the risks or the penalties of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to imagine a scene as when you actually view one. But evolution has seen to it that such internally generated representations are never as authentic as the real thing. This is a wise bit of self-restraint on your genes' part. If your internal model of the world were a perfect substitute, then anytime you felt hungry you could simply imagine yourself at a banquet, consuming a feast. You would have no incentive to find real food and would soon starve to death. As the Bard said, "You cannot cloy the hungry edge of appetite by bare imagination of a feast."

04 | According to the passage, what is one major evolutionary advantage of humans' ability to create visual imagery?

① It allows humans to remember every detail of past experiences perfectly.
② It helps humans rehearse future actions internally without real-world risks.
③ It enables humans to avoid using their senses in dangerous situations.
④ It makes imagined experiences more reliable than actual perception.

05 | What do Steve Kosslyn's brain-imaging studies suggest about imagining a scene and actually seeing one?

① Imagining a scene activates entirely different brain regions from seeing one.
② Seeing a scene requires less brain activity than imagining one.
③ The brain uses some of the same regions for imagination as for actual viewing.
④ Imagination is processed only in the emotional centers of the brain.

06 | Why, according to the passage, are internally generated representations not as authentic as real experience?

① Because human imagination declines with age and fatigue.
② Because perfect mental substitutes would remove the motivation to satisfy real needs.
③ Because the brain cannot store enough detail to form complete images.
④ Because external reality is controlled more by culture than by biology.

For each objective probability — from one percent to 100 percent — we want to know the subjective probability weight. When we make decisions, do we treat a one-percent chance just like one percent, or like something else? Events that could happen but aren't likely — low-probability events — can be defined as probabilities up to about 25 percent. Low-probability events tend to factor more into decisions than they should. That is, an event that has an objective one-percent chance of occurring could subjectively seem like it has a five-percent chance of occurring. We overestimate the likelihood of these low-probability events. In general, the smaller the probability, the more we overestimate its likelihood. For example, people who play the lottery are often optimistic about winning. However, the odds of a single ticket winning the largest, most popular U.S. lotteries are on the order of one in 175 million.

07 | What is the main question raised at the beginning of the passage?

① Whether objective probabilities can ever be measured accurately
② How people subjectively weight objective probabilities in decision-making
③ Why high-probability events are usually ignored by decision makers
④ Whether people prefer certainty over all forms of risk

08 | According to the passage, how do people typically respond to low-probability events?

① They usually underestimate them and dismiss them entirely
② They evaluate them exactly according to their objective probabilities
③ They tend to give them more weight than their objective probabilities justify
④ They only respond strongly when the probability is above 50 percent

09 | Why does the passage mention people who play the lottery?

① To show that people often overestimate extremely small chances of success
② To prove that lotteries are mathematically fair forms of entertainment
③ To argue that most lottery players understand probability very well
④ To suggest that one-percent chances are easier to judge than larger probabilities

Many of the barriers to trade exist not because of a lack of markets or customers, but because there are major barriers to getting products to market at competitive prices. Transaction costs are significant for companies — not only the straight exchange costs, but also the cost of converting, paying, and hedging funds just to pay for the goods and services. Having a common currency means that many of those transaction costs disappear and the savings can be reinvested back into firms' productivity and innovation. Basically, useless costs turn into productive costs — with longer-term benefits to the whole economy. By unifying some of the currencies, whole economies benefit and grow more than they would as independents. So a common currency provides for a strong economic foundation that all can benefit from.

10 | According to the passage, what is presented as a major barrier to trade?

① A shortage of customers in international markets
② High costs involved in getting products to market competitively
③ Excessive demand for foreign goods
④ A lack of innovation within firms

11 | What does the passage suggest happens when countries share a common currency?

① Firms face more complicated exchange procedures
② Transaction costs increase but become easier to track
③ Many costs related to converting, paying, and hedging funds are removed
④ Companies become less interested in productivity and innovation

12 | What is the main economic effect of unifying some currencies, according to the passage?

① Independent economies become more politically isolated
② Short-term consumer spending declines across all markets
③ Whole economies gain a stronger foundation and grow more than they would separately
④ Trade barriers disappear entirely in every industry

The light from even our nearest stellar neighbour takes four years to reach us. When we look at the stars, we are looking back in time. This is an incredible gift. We can see parts of space, parts of our universe, as they were many years ago. The further we can collect light from, the further back in time we can look. If you look at the bright star Betelgeuse, which glows in the Orion constellation, you wind time back more than six hundred years. Its reddish glow started its journey to Earth in the Middle Ages. The stars in Orion's belt are even further away. Their light, familiar to generations of humans, has travelled at least 1,000 years to reach us. This means we have a chance of understanding the history of the universe because we can see the more distant parts of it as they were in the past, thousands or millions or billions of years ago.

13 | According to the passage, what does it mean when we look at the stars?

① We are seeing them exactly as they are now
② We are looking back in time
③ We are measuring the temperature of space
④ We are imagining the past through science fiction

14 | What does the example of Betelgeuse mainly illustrate?

① Some stars are too faint to be studied from Earth
② The Orion constellation was first discovered in the Middle Ages
③ Light from distant stars can take centuries to reach Earth
④ Red stars move faster than other stars through space

15 | What conclusion does the writer draw from the fact that light from distant objects takes so long to reach us?

① Humans will eventually be able to travel through time
② The universe is becoming smaller and easier to understand
③ We can study the history of the universe by observing distant space
④ Only stars in Orion can reveal the past of the universe

The renowned British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a reduced purchase price by presenting the coupon. The extent to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no savings to recipients produced just as much customer response as did error-free coupons that offered substantial savings. The obvious but instructive point here is that we expect discount coupons to do double duty. Not only do we expect them to save us money, we also expect them to save us the time and mental energy required to think about how to do it. In today's world, we need the first advantage to handle pocketbook strain; but we need the second advantage to handle something potentially more important — brain strain.

16 | What idea of Alfred North Whitehead does the passage use as its starting point?

① Civilization declines when people stop thinking for themselves
② Civilization progresses when more actions become automatic
③ Civilization depends chiefly on technological invention
④ Civilization advances only when consumers spend less money

17 | In the example of the automobile-tire company, what was unusual about the mailed-out coupons?

① They were delivered to the wrong households
② They expired before customers could use them
③ Because of a printing error, they offered no actual savings
④ They could be used only for luxury tire models

18 | What does the customers' response to the faulty coupons mainly illustrate?

① Consumers carefully calculate every purchasing decision
② People often react to coupons mechanically, assuming they mean savings
③ Printing errors usually increase trust in advertising
④ Customers prefer coupons with complicated conditions

19 | According to the passage, what are the "double duty" functions of discount coupons?

① They increase product quality and reduce advertising costs
② They attract customers and encourage brand loyalty
③ They save money and reduce the mental effort of figuring out how to save it
④ They simplify manufacturing and improve customer service

Usually, innovative high-tech products have low price elasticity. This means that high variation in price, an increase as well as a decrease, does not significantly modify demand. These high-tech products have few substitutes, meaning that the costs to switch to another product are high. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less sensitive to price than to additional performance; they often have deep pockets or are ready to spend a lot for a new innovative and outstanding product. For instance, with its new product range, a high-end mobile phone manufacturer is aiming at the 3% of millionaire households with assets of more than $2.5 million; those are customers who are ready to accept the price range the manufacturer has set. At that stage, the competitors are not interested in lowering their price significantly whatsoever, because they are chasing the same categories of customers, not sensitive to price. Furthermore, the high price of these products is often perceived as a sign of quality and reinforces a customer's confidence in the company.

20 | What does the passage suggest about the price elasticity of innovative high-tech products?

① Demand changes greatly when the price rises or falls
② Demand is only affected when the price decreases
③ Demand does not change much despite price variation
④ Demand depends entirely on advertising rather than price

21 | According to the passage, why do these high-tech products tend to have low price elasticity?

① They are widely available from many competing firms
② They have many cheap substitutes in the market
③ Customers can easily switch to alternative products
④ They have few substitutes, making switching costs high

22 | In the early stage of a technology, what are buyers mainly more sensitive to than price?

① Brand history
② Additional performance
③ Store location
④ Packaging design

23 | Why are competitors not eager to lower their prices significantly at that stage?

① They want to attract budget-conscious consumers
② They are targeting the same customers, who are not very price-sensitive
③ They are unable to produce similar products
④ They believe lower prices always reduce product quality

The ancient medieval squares in places like Marrakesh and Siena are still places where stuff is sold every day, even if the stuff itself has changed over the last five hundred years. As she pointed out, the great advantage of a city architecture is its ability to support change in uses, and Jacobs correctly predicted the persistence of the city itself, unlike those who predicted the rise of the Internet would mean the death of the city.

24 | What does the passage suggest is an "easily underappreciated" quality of a city street or square?

① Its architectural beauty
② Its ability to remain useful over time
③ Its dependence on modern technology
④ Its role in reducing population growth

25 | What is the function of the example about a store that once sold buggy whips and typewriters but now repairs phones and sells bubble tea?

① To show that old businesses usually fail in modern cities
② To argue that consumers prefer nostalgic products
③ To illustrate how the same urban space can adapt to new economic uses
④ To prove that online shopping has replaced physical stores

26 | According to the passage, how did Jane Jacobs differ from people who believed the Internet would transform urban life?

① She argued that cities would lose their economic importance
② She believed city architecture could continue to support changing uses
③ She claimed medieval squares were no longer relevant to commerce
④ She predicted that all shopping streets would become digital marketplaces

Touched multiple times, arabidopsis cut its upward growth rate by as much as 30 percent.

27 | According to the passage, what did the genomics revolution allow researchers to understand more deeply?

① How plants compete with animals for nutrients
② How significantly touch affects plants
③ Why Arabidopsis thaliana grows only in laboratories
④ How plant hormones can be artificially controlled

28 | What did researchers discover after stroking Arabidopsis thaliana with soft paintbrushes?

① The plant became resistant to disease within a day
② Less than 1 percent of its genome showed any change
③ About 10 percent of its genome was altered within thirty minutes
④ Its roots grew faster than its stems

29 | Based on the passage, why did repeated touching reduce the plant's upward growth rate?

① The plant redirected energy to respond to disturbance rather than to grow taller
② The paintbrushes physically damaged the stem and stopped growth completely
③ The plant's exposure to light was blocked during the experiment
④ The researchers removed key hormones from the plant after each touch

This interference with the proper development and integration of neural networks can result in chronic stress and even mental illness.

30 | According to the passage, what is the main function of the freeze response when a person is startled?

① To improve verbal communication with others
② To avoid detection and prepare for possible danger
③ To help the body immediately fall asleep
④ To encourage social bonding through shared fear

31 | Why does the passage say language is often inhibited in highly stressful and traumatic situations?

① Because language evolved later than physical movement
② Because speaking can reveal one's location to a predator
③ Because people forget words when they are tired
④ Because traumatic situations make hearing impossible

32 | According to the passage, what can happen if a person's experiences shape the brain to remain in a constant state of fear?

① The person becomes better at using language under pressure
② The brain stops reacting to threats altogether
③ Chronic stress and even mental illness may result
④ Natural selection reverses the freeze response

33 | Why has video gaming become one of the most studied technologies in relation to empathy?

① Because most video games are specifically designed to teach empathy
② Because of longstanding concerns about the effects of violent video games on youth
③ Because empathy can only be measured through digital media
④ Because scientists agree that all forms of gaming increase compassion

34 | According to the passage, what is desensitization?

① A heightened emotional and physical reaction to repeated violence
② A temporary inability to understand fictional characters
③ A blunting of the normal negative emotional and physiological response to violence
④ A conscious decision to ignore violence in everyday life

35 | According to the passage, what is the likely consequence of diminished emotional responses to violence?

① Improved ability to separate fiction from reality
② Greater enjoyment of nonviolent games
③ Interference with recognizing or sympathizing with others, leading to reduced empathy
④ Stronger fear responses whenever violence is witnessed

36 | According to the passage, how do some brands misuse social purpose?

① By investing heavily in long-term social reform before advertising it
② By promoting their social purpose before doing much actual good
③ By refusing to connect social purpose with brand identity
④ By focusing only on employee satisfaction rather than public image

37 | What does the term "purpose-washing" most nearly mean in the passage?

① A sincere company-wide effort to solve social problems
② A marketing strategy that hides a brand's economic goals completely
③ The use of purpose-driven activities mainly as publicity or image-building
④ A process of changing a company's mission to enter future markets

38 | What is presented as a likely long-term consequence for purpose-washing brands?

① They secure strong positioning in future markets
② They gain lasting trust from employees and consumers
③ They benefit from differentiation without any serious risk

We can sometimes assume that the whole will be as good as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is productive and efficient. It might seem logical to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily true. The fallacy of composition fails to allow for how the different "parts" interact with each other — if, for example, your efficient administrator and your highly skilled head of IT each assumes the other is in charge of collating prototype test results, then you have a problem. Equally, a unit composed of good people can still be working on a doomed project, and a project composed of good ideas may lack a stable center. When assembling a team with a common goal, always check the overall view as well as the individuals involved.

② potential pitfalls of the fallacy of composition in teamwork
③ need for clear role assignment to avoid organizational errors

We can sometimes assume that the whole will be as good as each of its parts. Suppose, for example, you're in charge of a startup, and you know that everyone you've brought on board is productive and efficient. It might seem logical to assume that, as a result, the startup will be productive and efficient, too — but this isn't necessarily true. The fallacy of composition fails to allow for how the different "parts" interact with each other — if, for example, your efficient administrator and your highly skilled head of IT each assumes the other is in charge of collating prototype test results, then you have a problem. Equally, a unit composed of good people can still be working on a doomed project, and a project composed of good ideas may lack a stable center. When assembling a team with a common goal, _____.

① prioritize personal interests over shared organizational objectives
② consistently consider the big picture in addition to team members
③ only focus on maximizing each person's individual strengths alone
④ neglect possible conflicts among highly skilled professionals entirely
⑤ assume that every project will succeed without any oversight needed

Humans excel at visual imagery. Our brains evolved this ability to create an internal mental picture or model of the world in which we can rehearse forthcoming actions, without the risks or the penalties of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to imagine a scene as when you actually view one. But evolution has seen to it that such internally generated representations are never as authentic as the real thing. This is a wise bit of self-restraint on your genes' part. If your internal model of the world were a perfect substitute, then anytime you felt hungry you could simply imagine yourself at a banquet, consuming a feast. You would have no incentive to find real food and would soon starve to death. As the Bard said, "You cannot cloy the hungry edge of appetite by bare imagination of a feast."

① role of brain regions in visualizing scenes
② evolutionary purpose and limits of mental imagery
③ differences between imagining and perceiving reality
④ consequences of confusing imagination with actual needs
⑤ reasons why internal models cannot replace real experiences

Humans excel at visual imagery. Our brains evolved this ability to create an internal mental picture or model of the world in which we can rehearse forthcoming actions, without the risks or the penalties of doing them in the real world. There are even hints from brain-imaging studies by Harvard University psychologist Steve Kosslyn showing that your brain uses the same regions to imagine a scene as when you actually view one. But evolution has seen to it that such internally generated representations are never as authentic as the real thing. This is a wise bit of self-restraint on your genes' part. If your internal model of the world were a perfect substitute, then anytime you felt hungry you could simply imagine yourself at a banquet, consuming a feast. You would have no incentive to find real food and would soon starve to death. As the Bard said, "You cannot cloy the hungry edge of appetite by bare imagination of a feast."

The brain can (A)_____ scenes almost as if perceiving real ones, but evolution keeps such internal representations from being as (B)_____ as reality, so that they never become a perfect (C)_____ for the real thing.

For each objective probability — from one percent to 100 percent — we want to know the subjective probability weight. When we make decisions, do we treat a one-percent chance just like one percent, or like something else? Events that could happen but aren't likely — low-probability events — can be defined as probabilities up to about 25 percent. Low-probability events tend to factor more into decisions than they should. That is, an event that has an objective one-percent chance of occurring could subjectively seem like it has a five-percent chance of occurring. We overestimate the likelihood of these low-probability events. In general, the smaller the probability, the more we overestimate its likelihood. For example, people who play the lottery are often optimistic about winning. However, the odds of a single ticket winning the largest, most popular U.S. lotteries are on the order of one in 175 million.

The light from even our nearest stellar neighbour takes four years to reach us. When we look at the stars, we are looking back in time. This is an incredible gift. We can see parts of space, parts of our universe, as they were many years ago. The further we can collect light from, the further back in time we can look. If you look at the bright star Betelgeuse, which glows in the Orion constellation, you wind time back more than six hundred years. Its reddish glow started its journey to Earth in the Middle Ages. The stars in Orion's belt are even further away. Their light, familiar to generations of humans, has travelled at least 1,000 years to reach us. This means we have a chance of understanding the history of the universe because we can see the more distant parts of it as they were in the past, thousands or millions or billions of years ago.

① using starlight to observe the universe's past
② ways astronomers study ancient cosmic events
③ significance of Betelgeuse in historical observations
④ impact of stellar distances on our understanding of space
⑤ relationship between distance and light travel time in astronomy

The renowned British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a reduced purchase price by presenting the coupon. The extent to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no savings to recipients produced just as much customer response as did error-free coupons that offered substantial savings. The obvious but instructive point here is that we expect discount coupons to do double duty. Not only do we expect them to save us money, we also expect them to save us the time and mental energy required to think about how to do it. In today's world, we need the first advantage to handle pocketbook strain; but we need the second advantage to handle something potentially more important — brain strain.

① role of automatic behaviors in modern civilization

The renowned British philosopher Alfred North Whitehead asserted that "civilization advances by extending the number of operations we can perform without thinking about them." Take, for example, the "advance" offered to civilization by the discount coupon, which allows consumers to assume that they will receive a reduced purchase price by presenting the coupon. The extent to which we have learned to operate mechanically on that assumption is illustrated in the experience of one automobile-tire company. Mailed-out coupons that — because of a printing error — offered no savings to recipients produced just as much customer response as did error-free coupons that offered substantial savings. The obvious but instructive point here is that we expect discount coupons to do double duty. Not only do we expect them to save us money, we also expect them to _____. In today's world, we need the first advantage to handle pocketbook strain; but we need the second advantage to handle something potentially more important — brain strain.

①provide us with a sense of security and belonging in society
②offer us opportunities to build lasting relationships with others
③help us avoid unnecessary risks when making major purchases
④give us the resources necessary for long-term financial planning
⑤save us the time and mental energy required to think about how to do it

Usually, innovative high-tech products have low price elasticity. This means that high variation in price, an increase as well as a decrease, does not significantly modify demand. These high-tech products have few substitutes, meaning that the costs to switch to another product are high. Additionally, at the first stage of the technology, buyers — either innovators or forerunners — are less sensitive to price than to additional performance; they often have deep pockets or are ready to spend a lot for a new innovative and outstanding product. For instance, with its new product range, a high-end mobile phone manufacturer is aiming at the 3% of millionaire households with assets of more than $2.5 million; those are customers who are ready to accept the price range the manufacturer has set. At that stage, the competitors are not interested in lowering their price significantly whatsoever, because they are chasing the same categories of customers, not sensitive to price. Furthermore, the high price of these products is often perceived as a sign of quality and reinforces a customer's confidence in the company.

One easily underappreciated feature of a city street or square is its "future-proof" nature. The ancient medieval squares in places like Marrakesh and Siena are still places where stuff is sold every day, even if the stuff itself has changed over the last five hundred years. The city square is a fairly future-proof technology, as is the shopping street, even in an age of online shopping. For example, the same physical store that once sold buggy whips and typewriters might now repair damaged phones and sell bubble tea. The same infrastructure supports evolving uses. Jane Jacobs, the great prophet of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies . As she pointed out, the great advantage of a city architecture is its ability to support change in uses, and Jacobs correctly predicted the persistence of the city itself, unlike those who predicted the rise of the Internet would mean the death of the city.

The city square is a fairly future-proof technology, as is the shopping street, even in an age of online shopping. For example, the same physical store that once sold buggy whips and typewriters might now repair damaged phones and sell bubble tea. The same infrastructure supports evolving uses. Jane Jacobs, the great prophet of the city economy, made much of this fact in her books, including The Death and Life of Great American Cities and The Nature of Economies. As she pointed out, the great advantage of a city architecture is its ability to support change in uses, and Jacobs correctly predicted the persistence of the city itself, unlike those who predicted the rise of the Internet would mean the death of the city.

Because the same physical (A)_____ can keep (B)_____ ever-changing uses, a city stays future-proof, ensuring its long-term (C)_____ rather than the decline some once predicted.

The genomics revolution made it possible to see just how impactful touch is to plants on a deeper level. Peering at the genes of Arabidopsis thaliana, a weedy plant in the mustard family and the lab rat of the plant biology world, researchers saw that touch quietly triggered such a dramatic response in their hormones and gene expression that it could substantially inhibit their growth. They stroked the arabidopsis with soft paintbrushes, and then analyzed the plants' genetic responses. Within thirty minutes of being touched, 10 percent of the plant's genome was altered. Clearly, the plant was reorganizing its priorities to deal with the disturbance, and rerouting energy away from the hard work of getting taller. Touched multiple times, arabidopsis cut its upward growth rate by as much as 30 percent.

①role of genomics in understanding plant responses
②hormonal changes in plants following external stimuli
③mechanisms plants use to adapt to environmental changes
④impact of repeated disturbances on arabidopsis development
⑤effects of physical touch on plant growth and gene expression

Think about a time when you were startled. Did you come to a sudden stop, freeze all your movements, and hold your breath as you scanned the environment for a threat? All these responses maximize our ability to avoid detection, locate the source of possible danger, and prepare to fight or flee. As sophisticated as language has become, it is still the creation of sound that might give away our location to a potential predator. Because of this, the freeze response results in the inhibition of language in highly stressful and traumatic situations. Natural selection promoted the evolution of language but conserved the freeze rule. When the threat passes, we begin to relax and find our voices again, perhaps even to laugh at our own reactions. But what if we can never relax? What if our experiences shape our brain to be in a constant state of fear? This interference with the proper development and integration of neural networks can result in chronic stress and even mental illness.

Video gaming is one of the most studied technologies with regard to empathy. Because there have been longstanding concerns about the impact of violent video games on youth, much research has been conducted over the last couple of decades on the topic. While measuring and documenting the impact of video game violence, scientists have formulated credible explanations of how video gaming could affect empathy. Part of a normal, healthy reaction to witnessing violent events is to feel negative emotions, and to experience physiological arousal that is connected to fear or disgust. With repeated exposure to violent events — such as what might happen when a person plays violent video games — this normal reaction might become blunted, a phenomenon known as desensitization. The next step in this problematic process would be having diminished emotional responses to violence, which could also interfere with the ability to recognize and/or to sympathize with others, leading to reduced empathy. A significant body of work shows an association between extensive violent video gaming and reduced empathy in people.

①effects of violent video games on empathy
②role of negative emotions in processing violent content
③mechanisms behind emotional desensitization in gamers
④scientific concerns about youth engagement with technology
⑤relationship between physiological arousal and exposure to violence
